## Important Notice

Texas Instruments Incorporated and/or its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products, software and services at any time and to discontinue any product, software or service without notice. Customers should obtain the latest relevant information during product design and before placing orders and should verify that such information is current and complete.

All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment. TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI products, software and/or services. To minimize the risks associated with customer products and applications, customers should provide adequate design, testing and operating safeguards.

Any access to and/or use of TI software described in this document is subject to Customers entering into formal license agreements and payment of associated license fees. TI software may solely be used and/or copied subject to and strictly in accordance with all the terms of such license agreements.

Customer acknowledges and agrees that TI products and/or software may be based on or implement industry recognized standards and that certain third parties may claim intellectual property rights therein. The supply of products and/or the licensing of software does not convey a license from TI to any third party intellectual property rights and TI expressly disclaims liability for infringement of third party intellectual property rights.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products, software or services are used.

Information published by TI regarding third-party products, software or services does not constitute a license from TI to use such products, software or services or a warranty, endorsement thereof or statement regarding their availability. Use of such information, products, software or services may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

No part of this document may be reproduced or transmitted in any form or by any means, electronically or mechanically, including photocopying and recording, for any purpose without the express written permission of TI.

## 1.2 Abbreviations

AGCH	Access Grant Channel
AT	Attention sequence "AT" to indicate valid commands of the ACI
BCCH	Broadcast Control Channel
BS	Base Station
BSIC	Base Station Identification Code
C/R	Command/Response
C1	Path Loss Criterion
C2	Reselection Criterion
CBCH	Cell Broadcast Channel
CBQ	Cell Bar Qualify
CC	Call Control
CCCH	Common Control Channel
CCD	Condat Coder Decoder
CHAP	Challenge Handshake Authentication Protocol
CKSN	Ciphering Key Sequence Number
CRC	Cyclic Redundancy Check
DCCH	Dedicated Control Channel
DCOMP	Identifier of the user data compression algorithm used for the N-DPU
DISC	Disconnect Frame
DL	Data Link Layer
DM	Disconnected Mode Frame
DTX	Discontinuous Transmission
E	Extension bit
EA	Extension Bit Address Field
EL	Extension Bit Length Field
EMMI	Electrical Man Machine Interface
F	Final Bit
FACCH	Fast Associated Control Channel
FHO	Forced Handover
GACI	GPRS AT Command Interpreter
GMM	GPRS Mobility Management
GP	Guard Period
GRR	GPRS RR
GSM	Global System for Mobile Communication
HDLC	High-level Data Link Control
HISR	High level Interrupt Service Routine
HPLMN	Home Public Land Mobile Network
I	Information Frame
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
IP	Internet Protocol
IPCP	Internet Protocol Control Protocol
ITU	International Telecommunication Union
IWF	Interworking Function
Kc	Ciphering Key
L	Length Indicator
LAI	Location Area Information
LCP	Link Control Protocol
LISR	Low level Interrupt Service Routine
LLC	Logical Link Control

LPD	Link Protocol Discriminator
LQM	Link Quality Monitoring
M	More bit used to indicate the last segment of N-DPU
MAC	Medium Access Control
MCC	Mobile Country Code
MM	Mobility Management
MMI	Man Machine Interface
MNC	Mobile Network Code
MS	Mobile Station
MT	Mobile Termination
N(R)	Receive Number
N(S)	Send Number
NC	Network Control
NCC	National Colour Code
NCP	Network Control Protocol
NECI	New Establishment Causes included
N-PDU	Network Protocol Data Unit
NSAPI	Network Layer Service Access Point Identifier
OTD	Observed Time Difference
P	Poll Bit
P/F	Poll/Final Bit
PACCH	Packet Associated Control Channel
PAP	Password Authentication Protocol
PBCCH	Packet BCCH
PCCCH	Packet CCCH
PCOMP	Identifier of the protocol control information compression algorithm used for the N-DPU
PDCH	Packet Data Channel
PDP	Packet Data Protocol e.g. IP or X.25
PDTCH	Packet Data Traffic Channel
PRACH	Packet RACH
PSI	Packet System Information
PCH	Paging Channel
PCO	Point of Control and Observation
PDU	Protocol Data Unit
PL	Physical Layer
PLMN	Public Land Mobile Network
PPP	Point-to-Point Protocol
PTP	Point to Point
QoS	Quality of Service
RACH	Random Access Channel
REJ	Reject Frame
RLC	Radio Link Control
RNR	Receive Not Ready Frame
RR	Radio Resource Management
RR	Receive Ready Frame
RTD	Real Time Difference
RTOS	Real Time Operating System
SABM	Set Asynchronous Balanced Mode
SACCH	Slow Associated Control Channel
SAP	Service Access Point
SAPI	Service Access Point Identifier
SDCCH	Slow Dedicated Control Channel
SDU	Service Data Unit
SGSN	Serving GPRS Support Node
SIM	Subscriber Identity Module
SM	Session Management

SMS	Short Message Service
SMSCB	Short Message Service Cell Broadcast
SNDCP	Subnetwork Dependant Convergence Protocol
SNSM	SNDCP-SM
SS	Supplementary Services
TAP	Test Application Program
TBF	Temporary Block Flow
TCH	Traffic Channel
TCH/F	Traffic Channel Full Rate
TCH/H	Traffic Channel Half Rate
TCP	Transmission Control Protocol
TDMA	Time Division Multiple Access
TE	Terminal Equipment - e. g. a PC
TFI	Temporary Flow Identifier
TLLI	Temporary Logical Link Identifier
TMSI	Temporary Mobile Subscriber Identity
TQI	Temporary Queuing Identifier
UA	Unnumbered Acknowledgement Frame
UART	Universal Asynchronous Receiver Transmitter
UI	Unnumbered Information Frame
USF	Uplink State Flag
V(A)	Acknowledgement State Variable
V(R)	Receive State Variable
V(S)	Send State Variable
VPLMN	Visiting Public Land Mobile Network

## 1.3 Terms

Entity:	Program which executes the functions of a layer
Message:	A message is a data unit which is transferred between the entities of the same layer (peer-to-peer) of the mobile and infrastructure side. Message is used as a synonym to protocol data unit (PDU). A message may contain several information elements.
Primitive:	A primitive is a data unit which is transferred between layers on one component (mobile station or infrastructure). The primitive has an operation code which identifies the primitive and its parameters.
Service Access Point	A Service Access Point is a data interface between two layers on one component (mobile station or infrastructure).

## 2 Overview

The Protocol Stacks are used to define the functionality of the GSM protocols for interfaces. The GSM specifications are normative when used to describe the functionality of interfaces, but the stacks and the subdivision of protocol layers does not imply or restrict any implementation.

The protocol stack for GPRS consists of several entities. Each entity has one or more service access points, over which the entity provides a service for the upper entity.

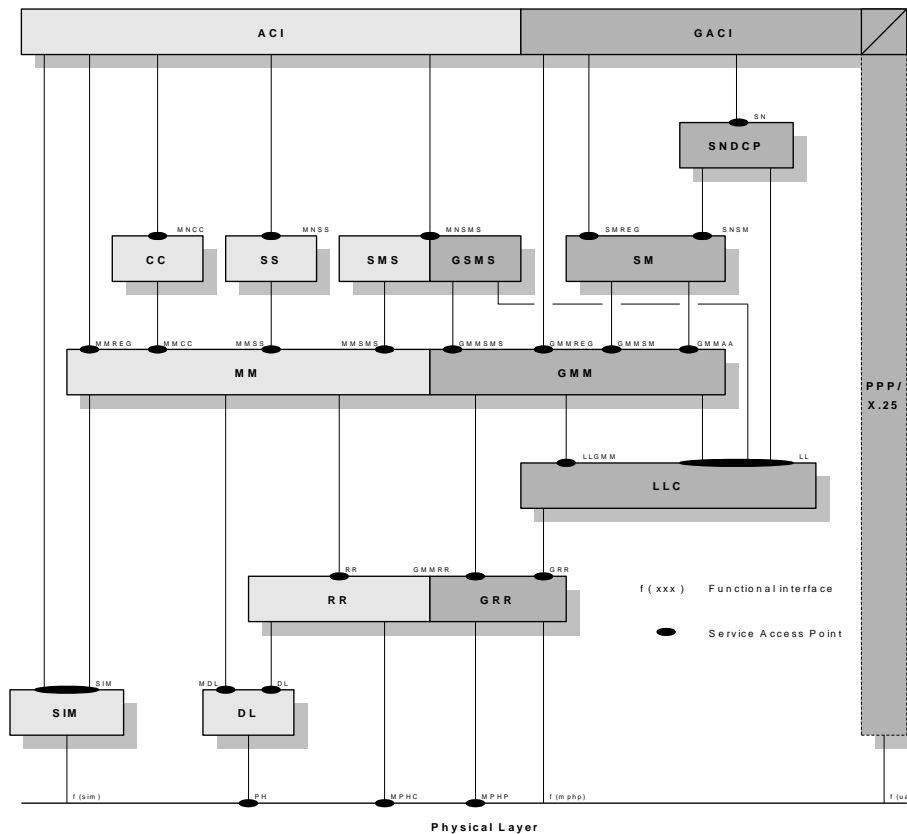

Figure 2-1: Architecture of the GSM/GPRS protocol stack

The information units passed via the SAPs are called primitives and consists of an operation code and several parameters. See the Users Guide for details.

The entities of the GPRS protocol stack are:

## 2.1 GRR (RLC/MAC) – Radio Link Control/Medium Access Control

This layer contains two functions: The Radio Link Control function provides a radio-solution-dependent reliable link. The Medium Access Control function controls the access signalling (request and grant) procedures for the radio channel, and the mapping of LLC frames onto the GSM physical channel.

## 2.2 LLC – Logical Link Control

The LLC entity provides multiple highly reliable logical links for asynchronous data transfer between the MS and the network. It supports variable-length information frames, acknowledged and unacknowledged data transfer, flow and sequence control, error detection and recovery, notification of unrecoverable errors, user identity confidentiality, and ciphering of user data.

## 2.3 GMM – GPRS Mobility Management

The GMM entity provides procedures for the mobility of the MS, such as informing the network of its present location, and user identity confidentiality. It manages the GMM context (attach, detach, routing area updating), supports security functions such as authentication of user and MS, controls ciphering of user data, and initiates the response to paging messages.

## 2.4 SM – Session Management

The main function of the session management (SM) is to support PDP context handling of the user terminal. Session Management activates, modifies and deletes the contexts for packet data protocols (PDP). Session Management services are provided at the SMREG-SAP and the SNSM-SAP for anonymous and non-anonymous access. The non-anonymous and anonymous access procedures for PDP context activation and PDP context deactivation are available at the SMREG-SAP. In addition there exists a PDP context modification for non-anonymous PDP contexts.

## 2.5 SNDCP - Subnetwork Dependant Convergence Protocol

SNDCP carries out all functions related to transfer of Network layer Protocol Data Units (N-PDUs) over GPRS in a transparent way. SNDCP helps to improve channel efficiency by means of compression techniques. The set of protocol entities above SNDCP consists of commonly used network protocols. They all use the same SNDCP entity, which then performs multiplexing of data coming from different sources to be sent using the service provided by the LLC layer.

## 2.6 GACI – GPRS AT Command Interpreter

The ACI is the GPRS extension of the ACI. It is specified in GSM 07.60. It is responsible for processing of the GPRS related AT Commands to setup, activate and deactivate the PDP context parameter. It also provides functionality for the interworking between GMM/SM/SNDCP and a packet oriented protocol like PPP.

## 2.7 USART - Universal Synchronous Asynchronous Receiver Transmitter Driver

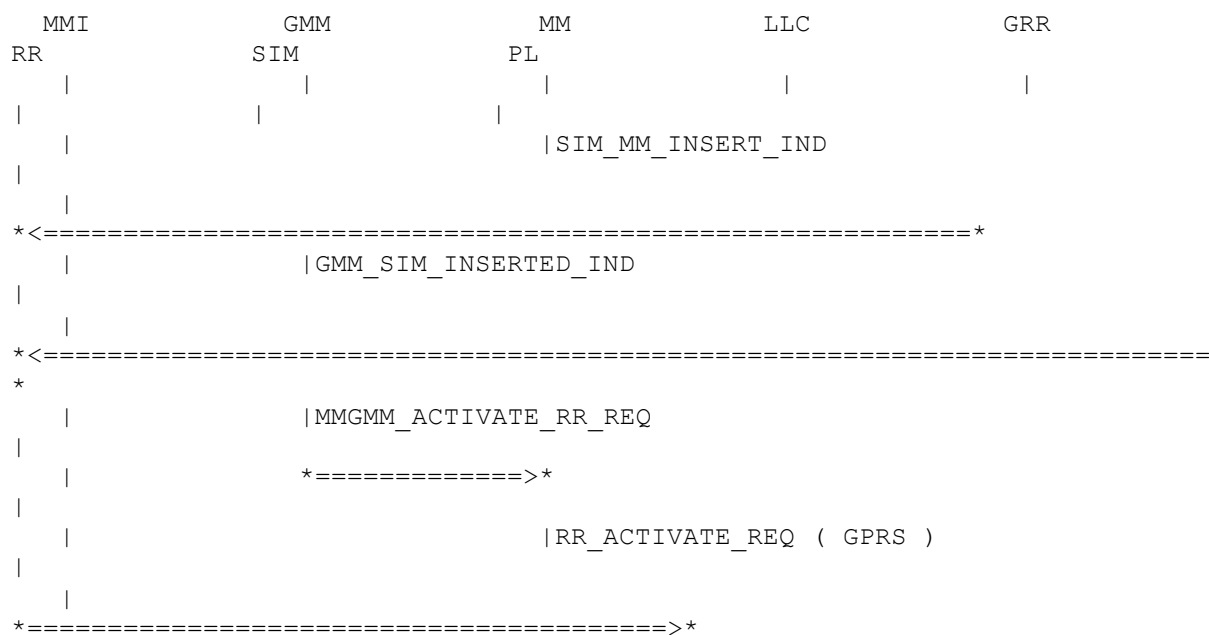

The USART is a hardware component that facilitates a connection between the mobile station and terminal equipment (e.g. a PC). This interface uses some of the circuits described in V.24.

The data exchange provided by this unit is serial and asynchronous (synchronous communication is not in the scope of this document). A driver that uses interrupts to manage a circular buffer for the sending and receiving direction is necessary in order to use this component in the GPRS. The driver has to be able to perform flow control.

History:

Initial

## 5.2 Cell found – mobile class BG

### 5.2.1 MGM010: IMSI Cell found

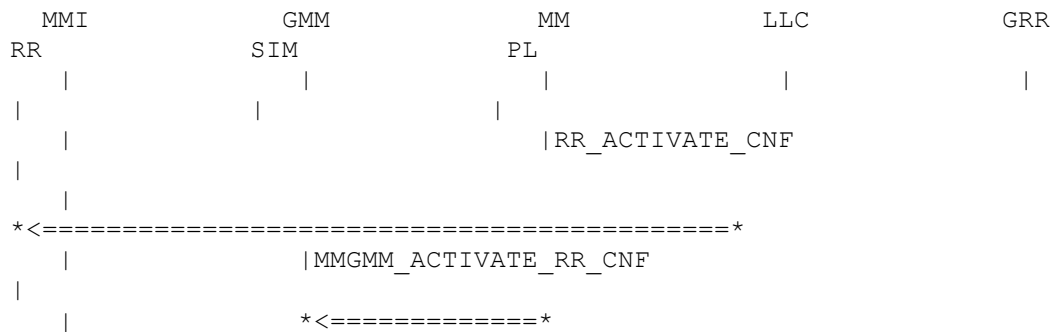

Description:

MS class BG.

Successful conclusion of cell selection is signalled by the receipt of a RR-ACTIVATE confirmation primitive. MM forwards the PLMN identification to GMM and GMM to MMI in the form of a GMMREG\_ATTACH\_IND confirmation primitive.

Preamble:

MGM002

History:

10-Apr-00      ANS      Initial

## 5.2.2 MGM011: GPRS Cell not found

Description:

MS class BG.

No GPRS cell was found by RR. RR informs GRR that the current cell does not support GPRS. GRR passes this information to GMM and GMM switches the main activities to the GSM side with the MM\_ACTIVATE\_MM\_REQ primitive. MM has to act as an GSM-only mobile until the MM\_DEACTIVATE\_MM\_REQ primitive is received. That means, MM has to start the attach procedure on its own. After successful location update (LAU) MM informs GMM and not MMI about the result. GMM forwards this information to MMI. If the LAI is changed, MM forwards GMM the LAI.

Preamble:

MGM010

### 5.2.3 MGM012: GPRS Cell found in state GPRS deactivated

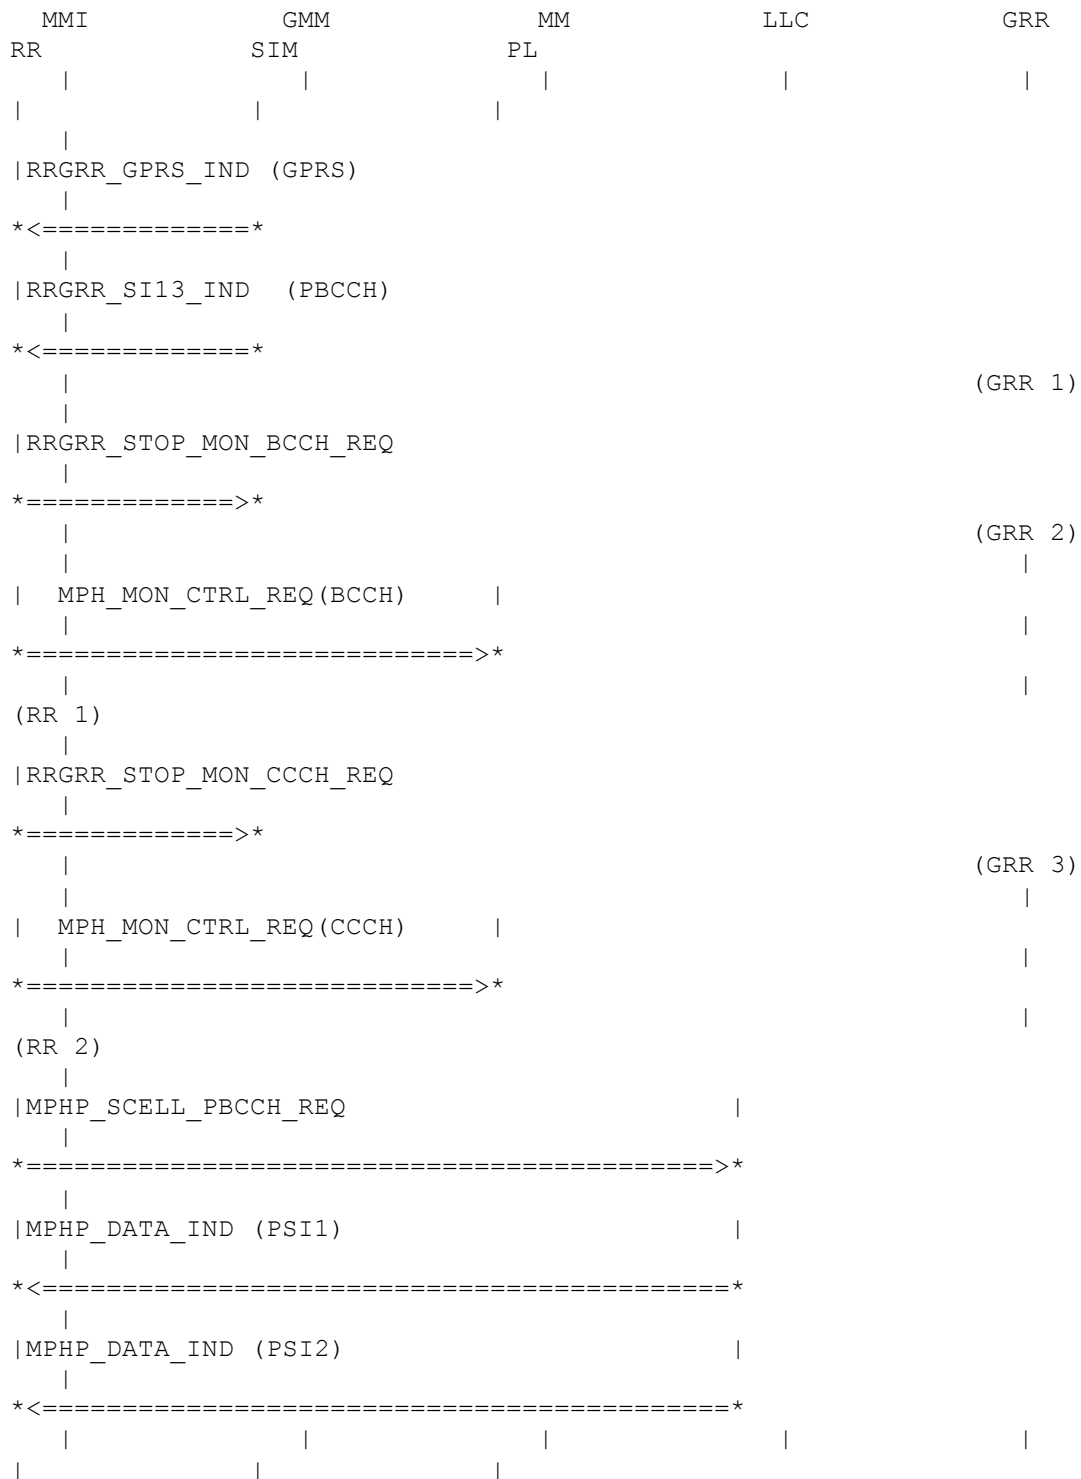

Description:

MS class BG.

RR informs GRR about finding a GPRS cell.

Preamble:

MGM011

(RR 1)  
tbd

(GRR 3)  
GRR stops CCCH listening in idle mode.

(RR 2)  
tbd

History:

10-Apr-00	ANS	Initial
24-Jul-00	MPA	revised

## 5.2.4 MGM013: GPRS Cell found in state GPRS deactivated – net mode III

Description:

MS class BG.

GRR informs GMM that a cell in network mode of operation III was found. MM is deactivated and is requested to start its own IMSI detach procedure. When the detach procedure is finished MM forwards the result to GMM and MMI is informed. GMM starts the normal attach procedure.

Preamble:

MGM012

```

```

#### History:

10-Apr-00	ANS	Initial
24-Jul-00	MPA	revised

### 5.2.5 MGM014: Change of net mode from III to II

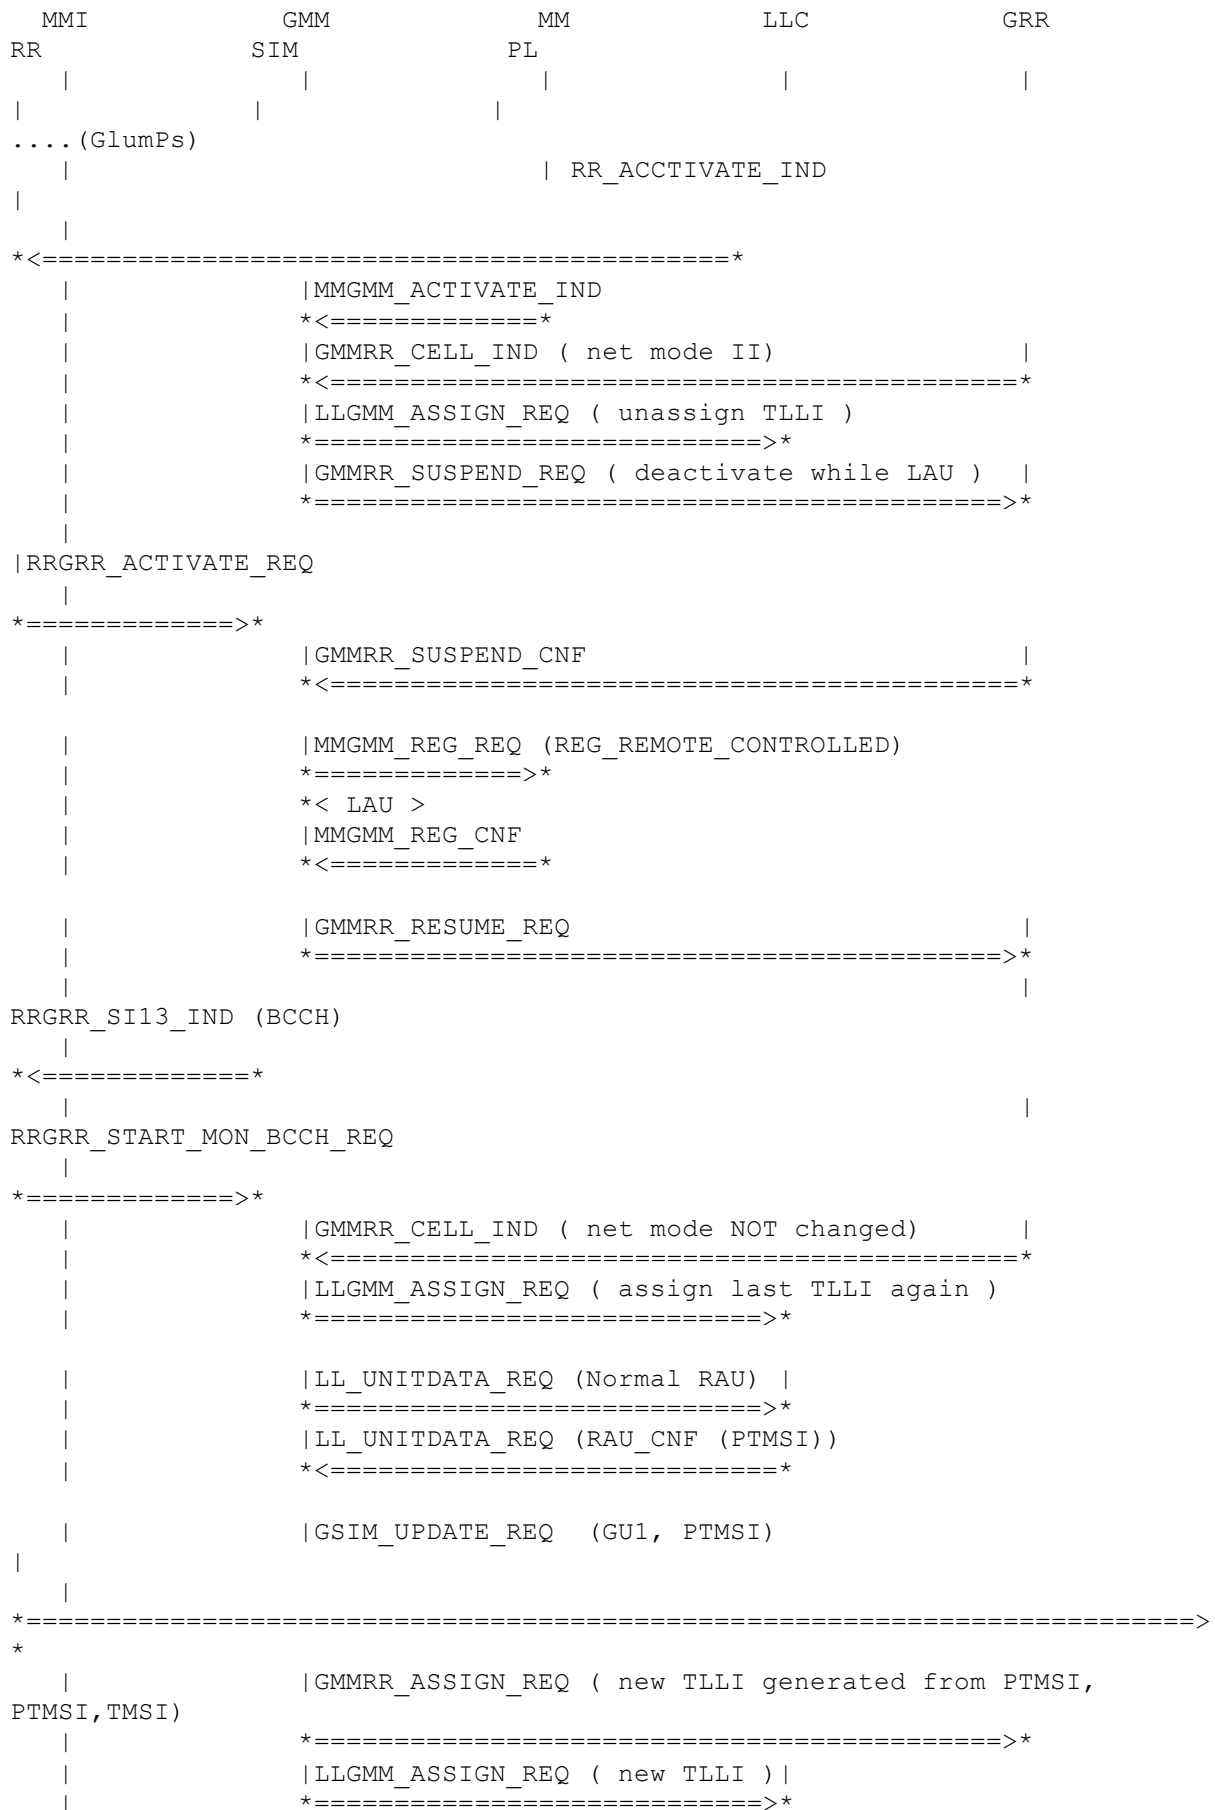

#### Description:

MS class BG.  
GPRS-only attached.

GRR changes the routing area and the network mode of operation changes from III to II. GMM suspends GRR and requestes MM to perform the IMSI attach proceduere with indicating the result to GMM at the end. MM is still in state DEACTIVATED. After location update proceudre GRR is resumed, GRR selects all GPRS cell relevant data and passes this data with GMMRR\_CELL\_IND to GMM. GMM performs the normal routing area up-date procedure and indicates the result to MMI.

#### Preamble:

MGM013

```
| GMMREG_ATTACH_CNF (GPRS and CS attached)

24-Jul-00	MPA	revised

## 5.2.6 MGM015: Change of net mode from III to I

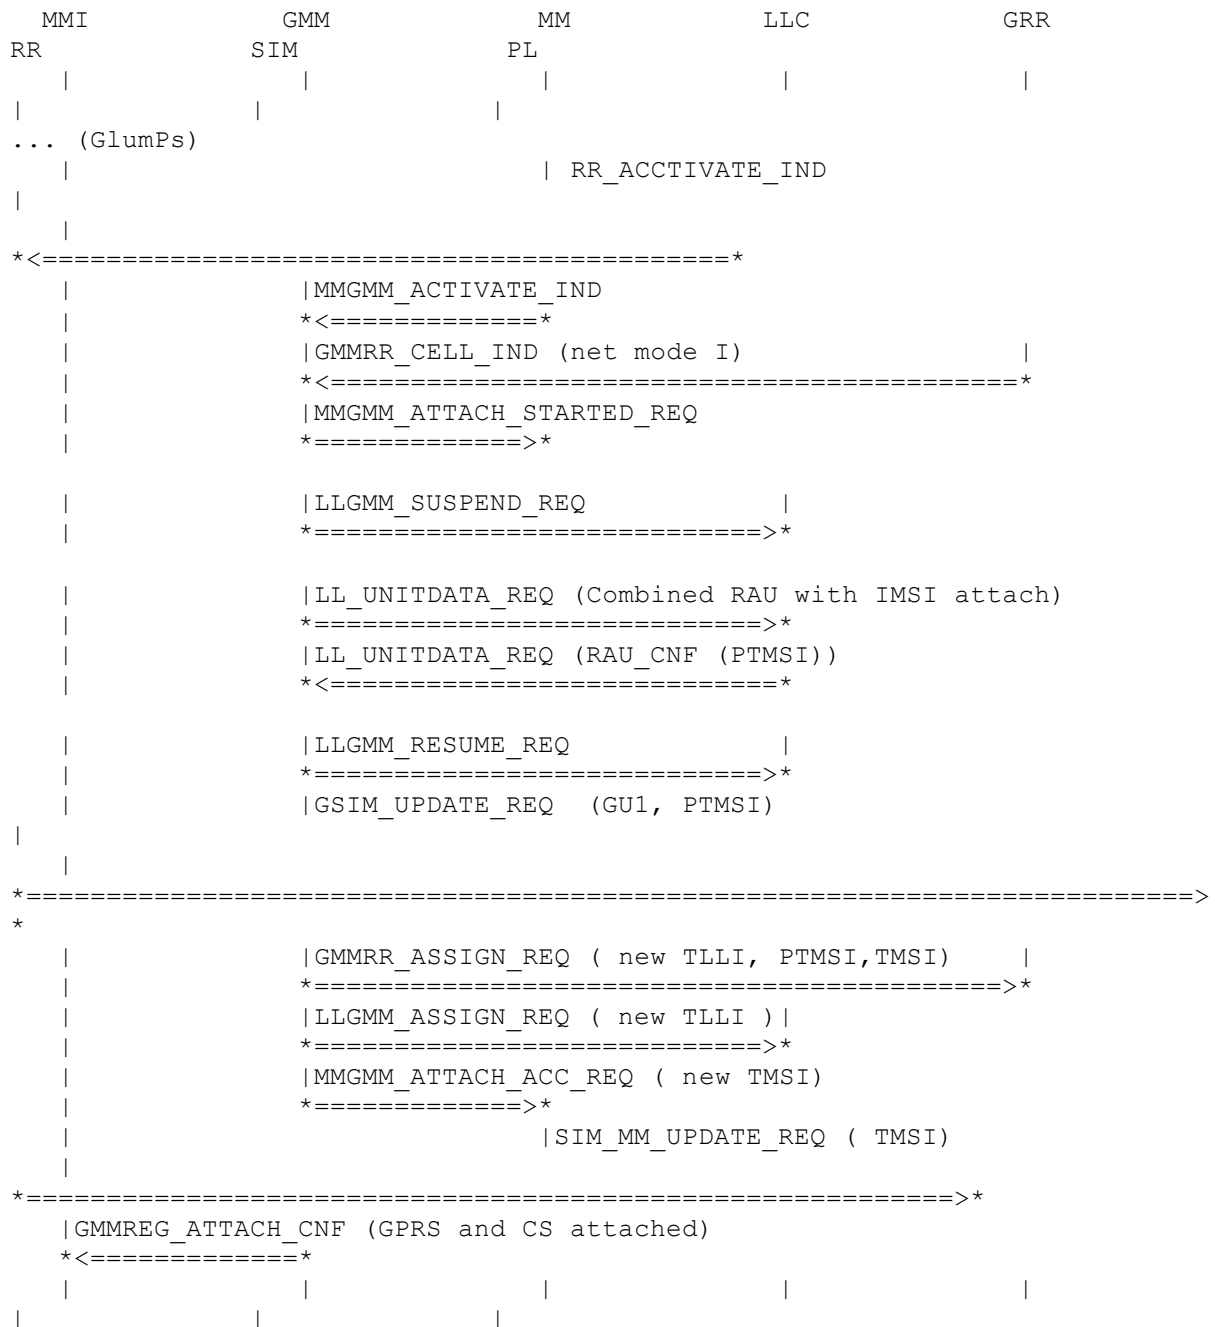

#### Description:

MS class BG.  
GPRS-only attached.

GRR changes the routing area and the network mode of operation changes from III to I. GMM performs the combined routing area update procedure and indicates the result to MM and MMI. MM sets the update state to U1 resets the location update attempt counter and gets the new TMSI. The TMSI is passed to SIM and the PTMSI is passed to GSIM.

#### Preamble:

MGM013

#### History:

10-Apr-00	ANS	Initial
25-May-00	ANS	??_activate_ind added

## 5.2.7 MGM016 Change of net mode from I to II

#### Description:

MS class BG.  
net mode I.  
Combined attached.

GRR changes the routing area and the network mode of operation changes from I to II. GMM suspends GRR to request MM to perform location update on its own procedures. After finishing location update GMM resumes GRR and performs normal routing area update.

Preamble:

MGM015

## 5.2.8 MGM017 Change of net mode from I to III

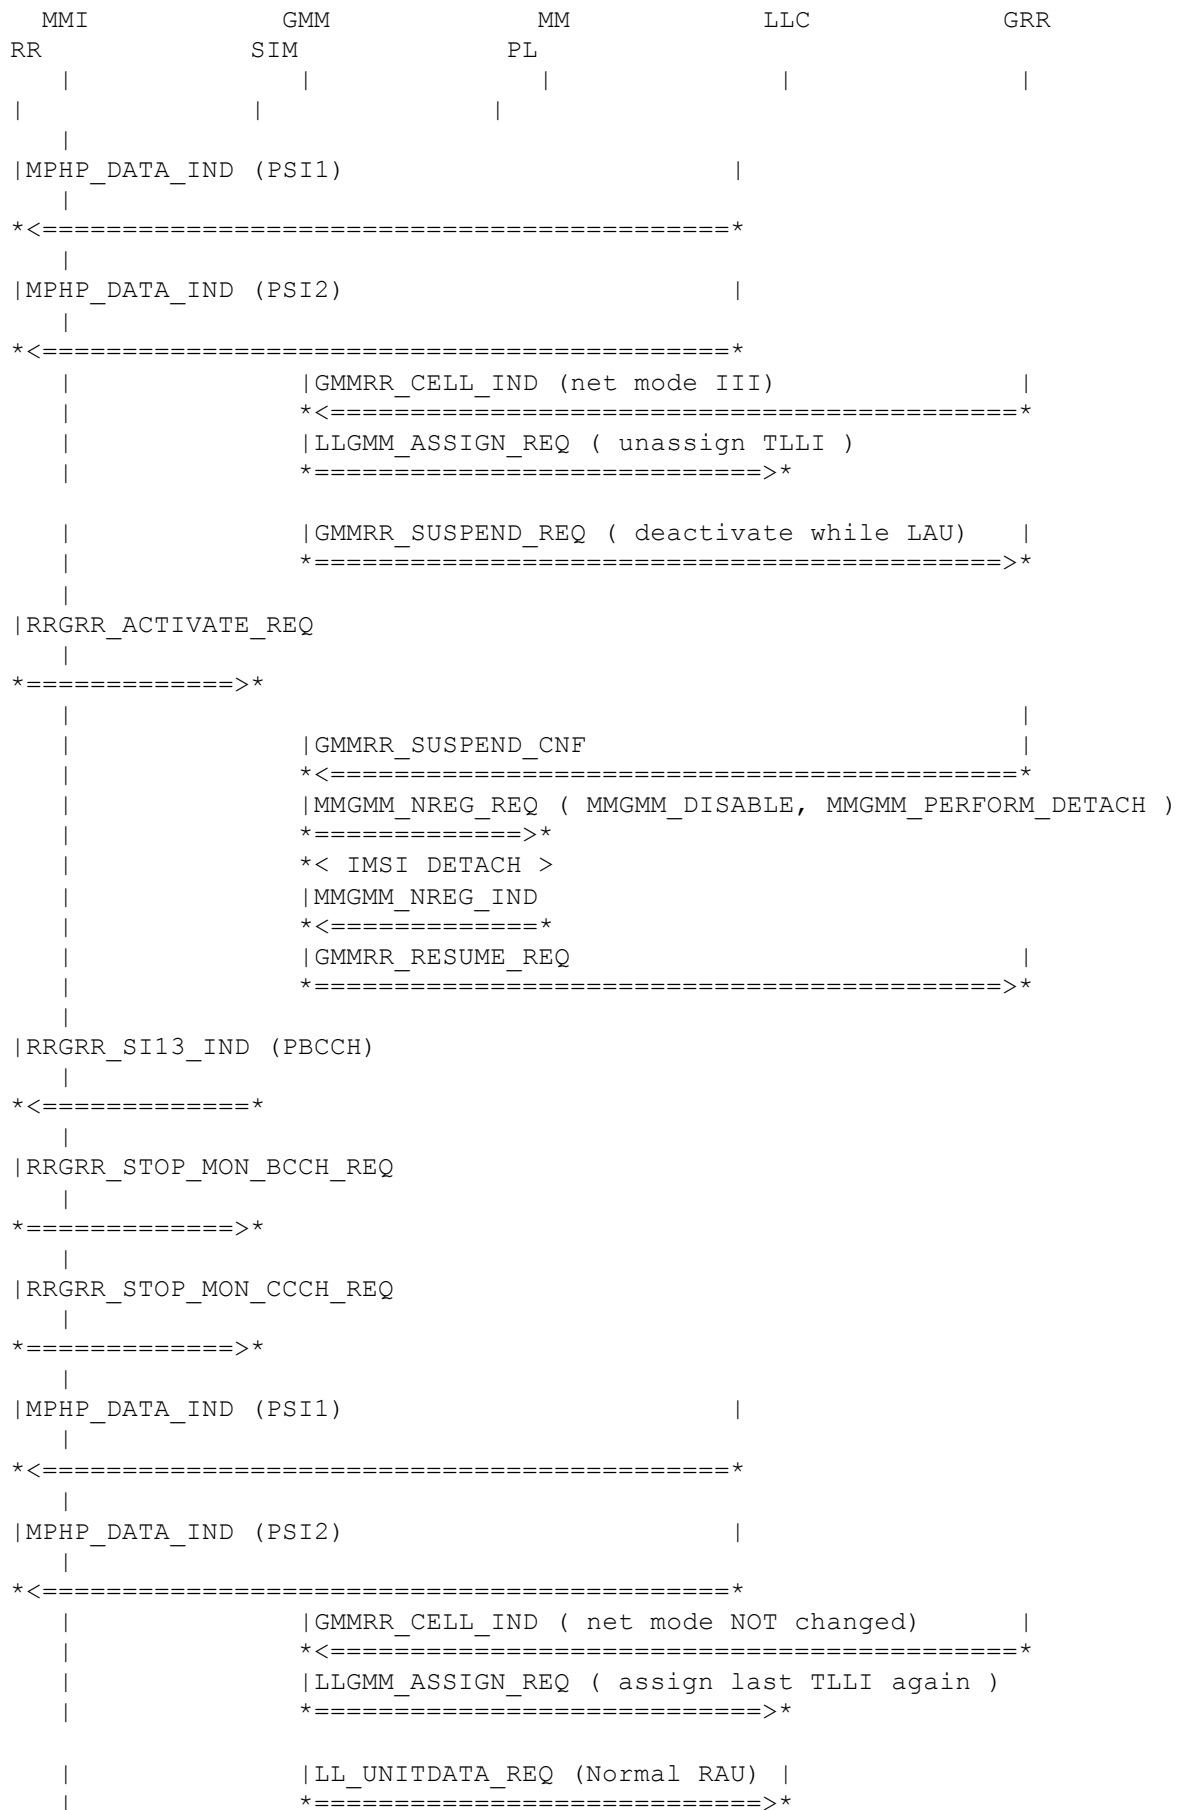

Description:

MS class BG.  
net mode I.  
Combined attached.

GRR changes the routing area and the network mode of operation changes from I to III.  
GMM suspends GRR to request MM to perform location update by its own procedures.  
After finishing location update GMM resumes GRR and performs normal routing area update.

Preamble:

MGM015

```

|          |LL_UNITDATA_REQ (RAU_CNF PTMSI)

### 5.2.9 MGM018: Automatic network selection mode

#### Description:

MS class BG.

#### Preamble:

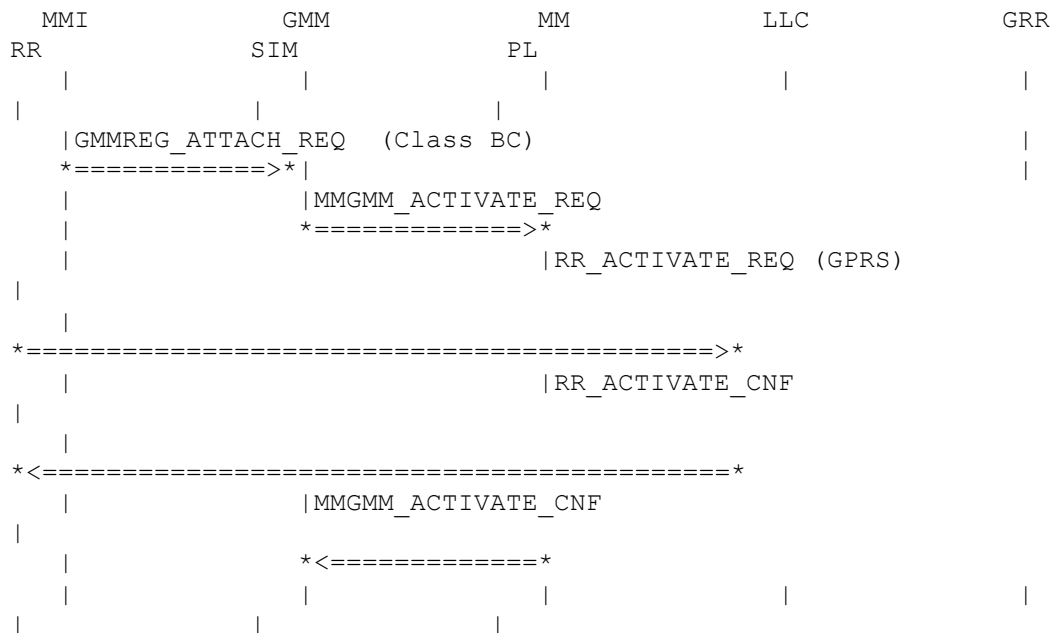

MGM002

### 5.3.1 MGM200: IMSI Cell found

MMI switches to class BC mobile.  
Successful conclusion of cell selection is signalled by the receipt of a RR-ACTIVATE confirmation primitive.

MGM013

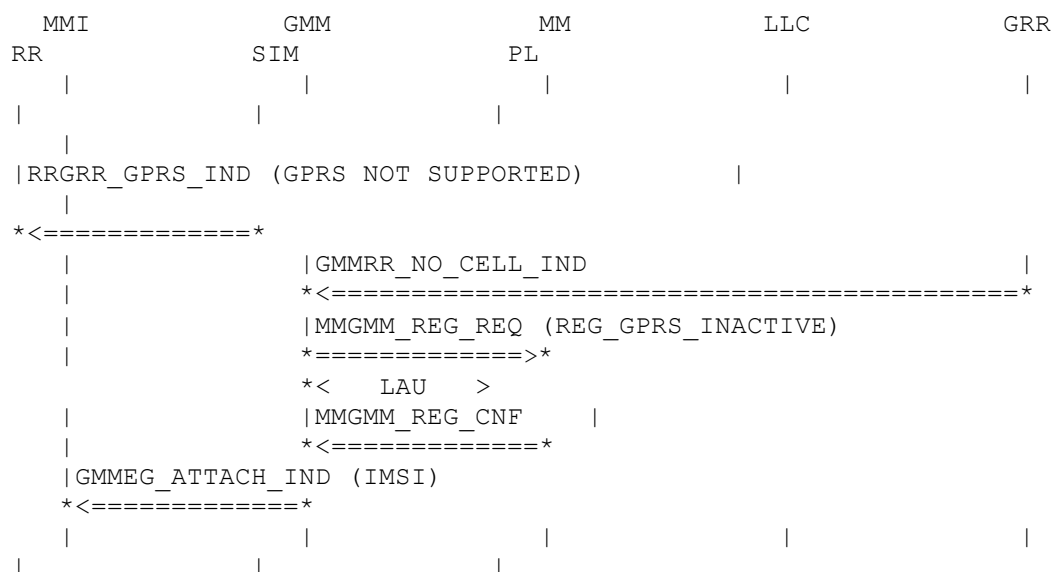

10-Apr-00                      ANS                      Initial

Description:

NO GPRS cell was found by RR. RR informs GRR that the current cell does not support GPRS. GRR passes this information to GMM and GMM switches the main activities to the GSM side with the MM\_ACTIVATE\_MM\_REQ primitive. MM has to act as an GSM-only mobile until the MM\_DEACTIVATE\_MM\_REQ primitive is received. That means, MM has to start the attach procedure on its own. After successful location update (LAU) MM informs GMM and not MMI about the result. GMM forwards this information to MMI. If the LAI is changed, MM forwards GMM the LAI.

MGM200

History:

10-Apr-00

ANS

Initial

### 5.3.3 MGM202: GPRS Cell found in state GPRS deactivated

Description:

MS class BC.  
IMSI only attached.

RR informs GRR about finding a GPRS cell. GMM requests GRR to search for a cell which supports a different net mode than net mode III.

Preamble:

MGM201

#### 5.3.4 MGM203: GPRS Cell found in state GPRS deactivated – net mode III

GRR informs GMM that a cell in network mode of operation III was found.

MGM202

### 5.3.5 MGM206: Change of net mode from III to a different one

MS class BC.  
IMSI-only attached.

Variant A: net mode I found  
Variant B: net mode II found

MGM203

<A>....<B>

### 5.3.6 MGM204: Change of net mode from III to II

GRR has changed the routing area and the network mode of operation changes from III to II. GMM suspends GRR to request MM to perform location update procedure. At the end of this procedure GMM switches on GRR again and perform the GPRS attach procedure.

### 5.3.7 MGM205: Change of net mode from III to I

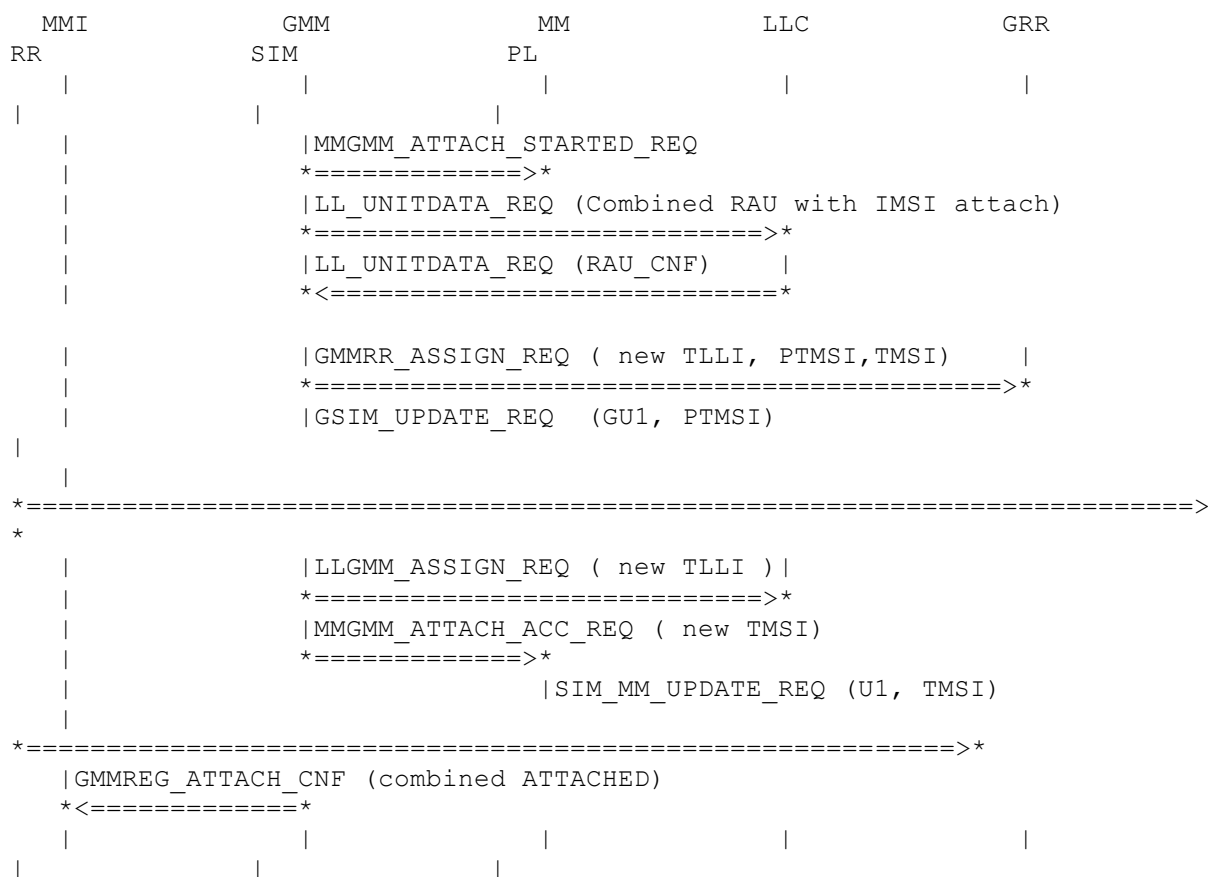

#### Description:

MS class BC.  
IMSI-only attached.  
MM deactivated.

GRR has changed the routing area and the network mode of operation changes from III to I. GMM performs the combined routing area update procedure and indicates the result to MM and MMI. MM sets the update state to U1 resets the location update attempt counter and gets the new TMSI. The TMSI is passed to SIM and the PTMSI is passed to GSIM.

#### Preamble:

## 5.6 Packet Access using CCCH

### MGM403: Mobile originated packet access - B

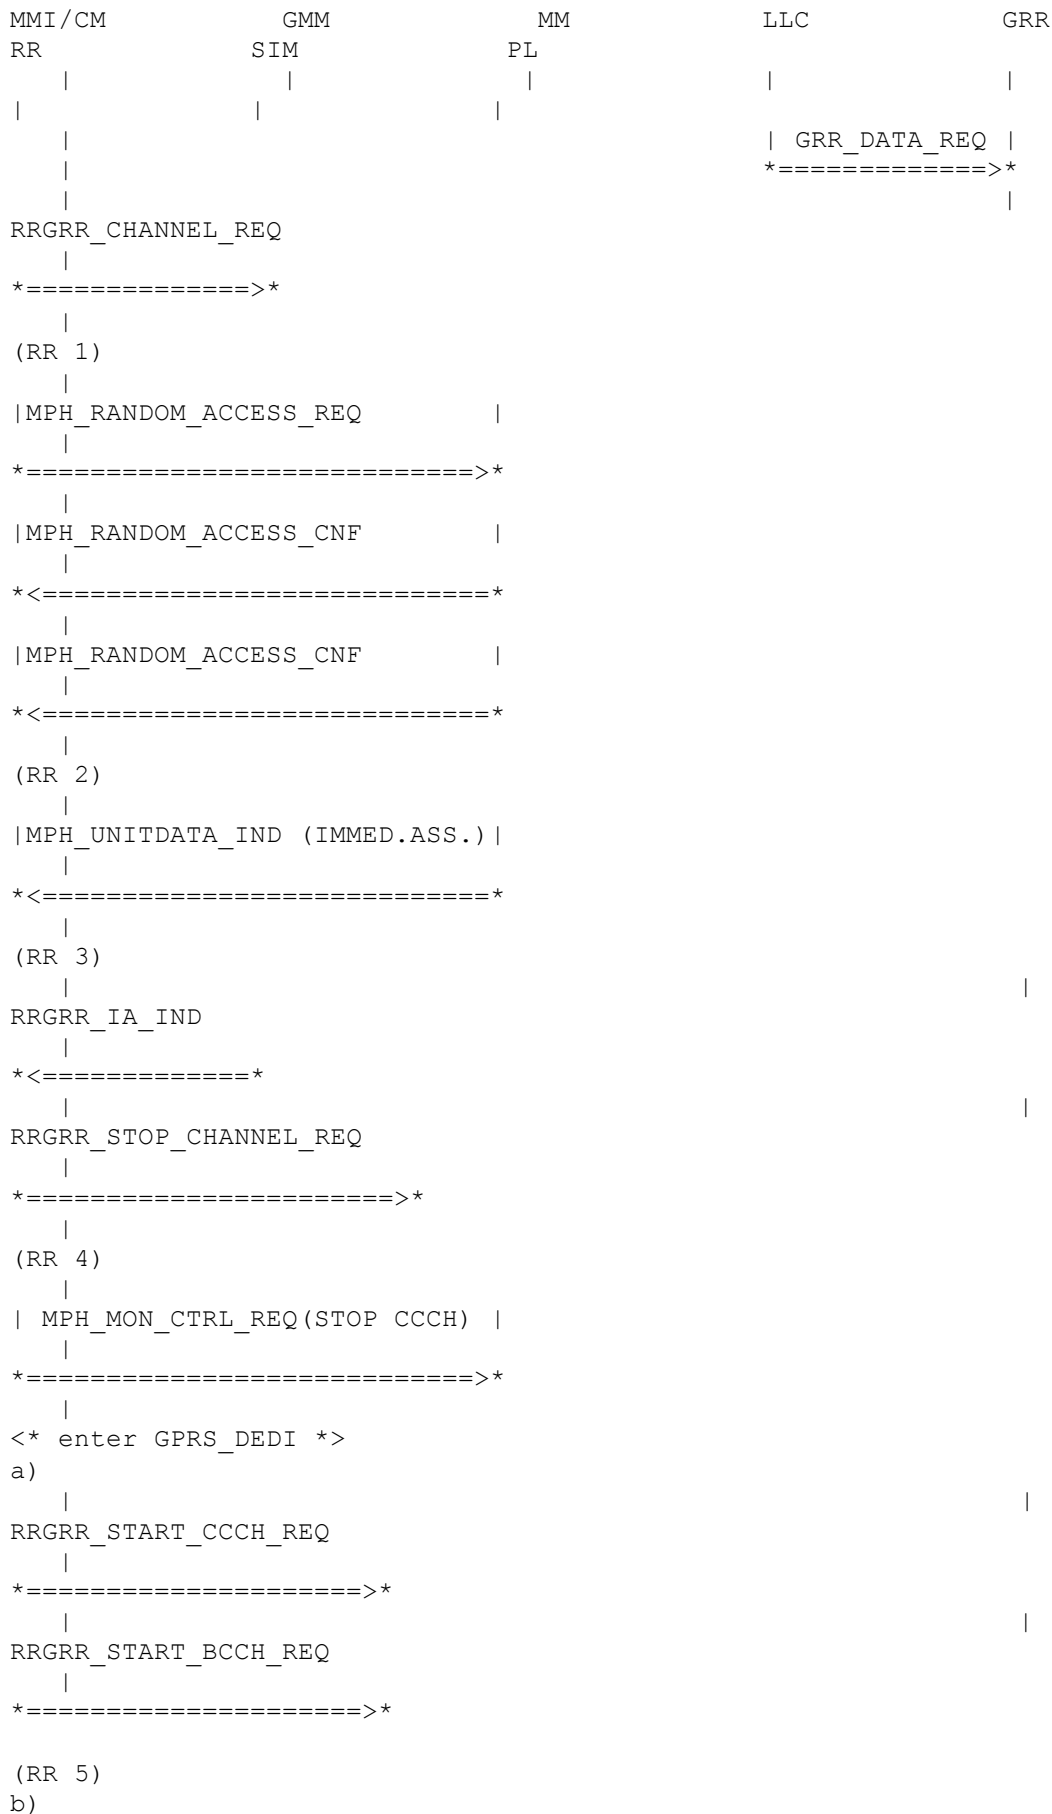

Description:

MS class B.  
net mode II.  
IMSI attached.

The MS successfully allocates a PDCH to start TBF.

Preamble:

MGM

```

|
|
RRGRR_CELL_RESELECTION_REQ
|

```

```

*=====>*

```

```

|
(RR 5)
|

```

(RR 1)

RR receives the channel request from GRR. RR starts the access procedure on the CCCH. RR does not need to check if there is a call active (GMM/GRR know this) or if the access is allowed (also checked by GRR). The wait indication (T3122) needs not to be checked for packet access and T3142 is checked by GRR.

(RR 2)

T3146 is started after sending all random bursts. T3146 uses T3126 (the GSM equivalent) as they are the same.

(RR 3)

On receipt of an Immediate Assignment message RR checks if the Message is either a TBF or dedicated mode assignment (If the Immediate Assignment message was part of a TMA (two message assignment) is by from RR, as PL handles the TMA and sends only the relevant part to RR). RR checks if the IA is valid by comparing the random access reference. For a valid TBF assignment RR informs GRR via the RRGRR\_IA\_IND (there is also only 1 RRGRR\_IA\_IND for a two message assignment with all the relevant parts merged). For a dedicated mode assignment RR sends a RRGRR\_IA\_IND if GRR requested a channel else the normal RR procedures are used. T3146 is stopped on receipt of a valid IA.

(RR 4)

RR waits either for a RRGRR\_STOP\_CHANNEL\_REQ in the case of a PDCH assignment or for a RRGRR\_DATA\_REQ in the case of a dedicated mode assignment. On receipt of a RRGRR\_STOP\_CHANNEL\_REQ RR stops CCCH listening in PL and enters the GPRS\_DEDI state waiting to resume normal operation (ie cell reselection after leaving the PDCH). On receipt of a RRGRR\_DATA\_REQ RR uses this message as SABM message and enters normal GSM dedicated mode. XXX This has to be checked if this really works (ie. If the data req takes too long time, there is a network timer waiting for the SABM, also the RR procedure has to be totally reworked. It would be better if we already get the DATA\_REQ before receiving the IA, if possible).

(RR 5)

Entering idle mode. XXX is still open for discussion.

History:

22-Jul-00	MPA	revised

### 5.6.1 MGM404: Mobile originated packet access - B

Description:

MS class B.  
net mode II.  
IMSI attached.

The MS successfully allocates a SDCCH. For comments see MSC above.

Preamble:

MGM

|  
\* <===== \*  
|

History:

12-Apr-00

MPA

Initial

## 5.6.2 MGM405: Mobile originated packet access - B

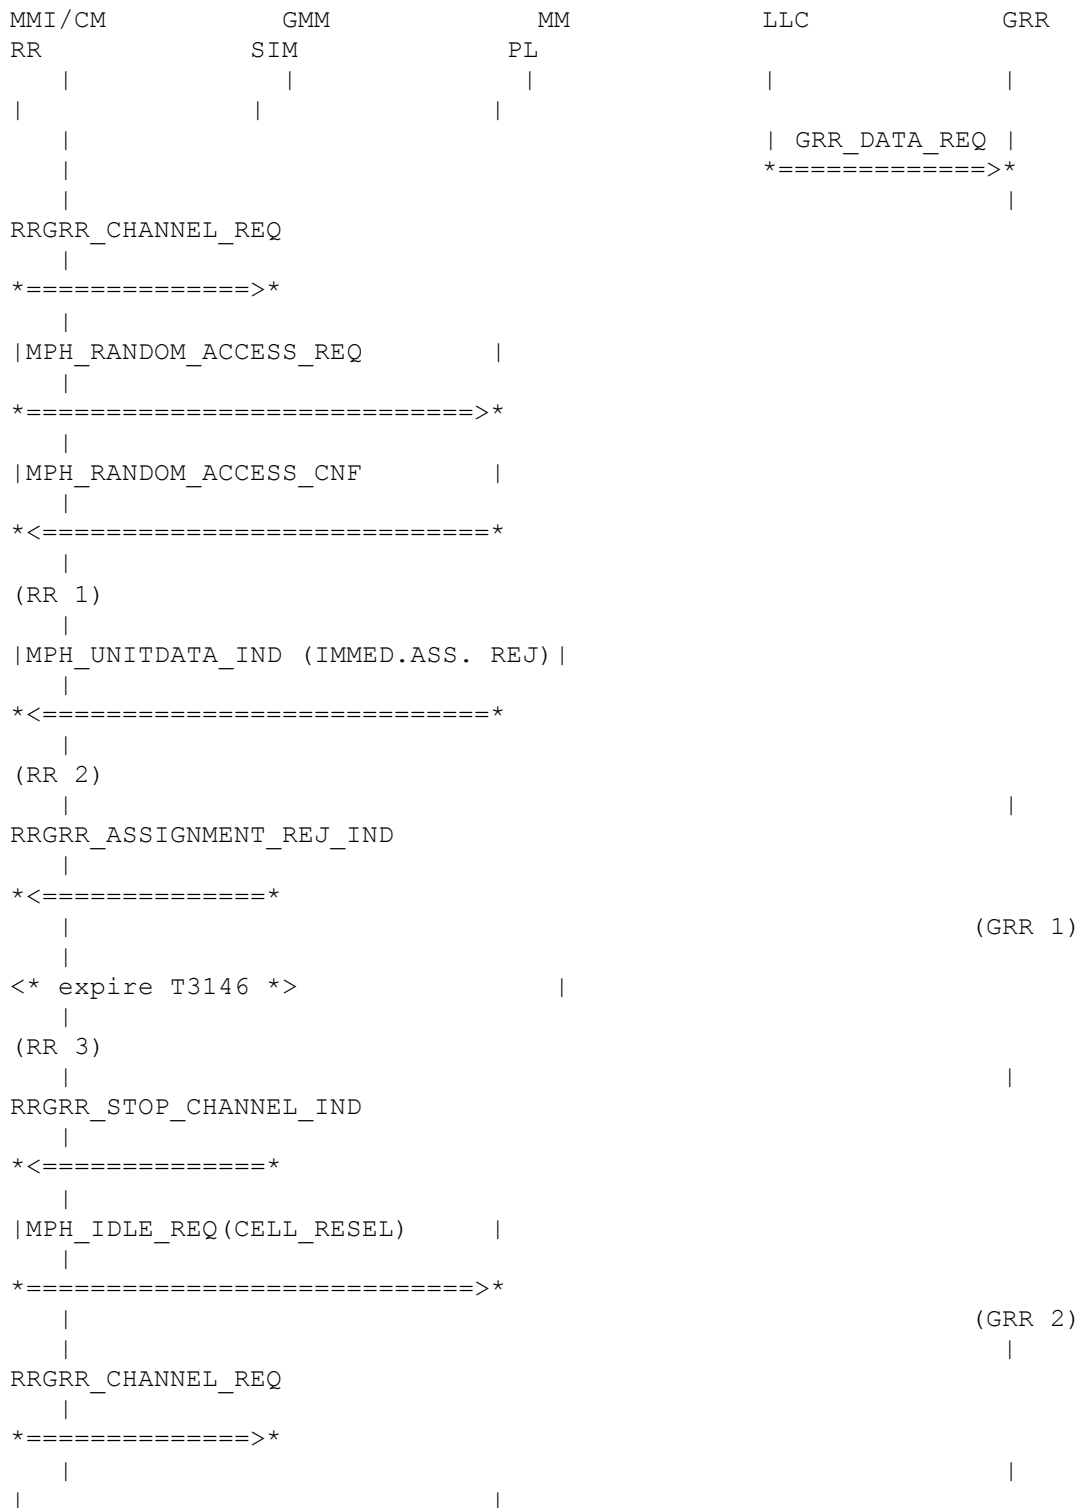

### Description:

MS class B.  
net mode II.  
IMSI attached.

The MS tries to allocate a PDCH but receives a Immediate Assignment Reject.

### Preamble:

MGM

(RR 1)  
RR starts timer T3146 after sending the last random burst.

(RR 2)  
RR receives a Immediate Assignment Reject message. RR checks if the IA is valid by comparing the random access reference and informs GRR via a RRGRR\_ASSIGNMENT\_REJ\_IND.

(GRR 1)

GRR starts the wait indication timer(T3142).

(RR 3)

If timer T3146 expires RR aborts the Packet Access procedure. RR informs GRR via the RRGRR\_STOP\_CHANNEL\_IND and starts a cell reselection to enter idle mode.

(GRR 2)

After T3143 expires GRR can retry the packet access procedure. If there is a GRR\_RR\_EST\_REQ from RR while T3142 is running, the timer can be ignored as it only should prevent packet access.

History:

12-Apr-00	MPA	Initial
23-Jul-00	MPA	revised

### 5.6.3 MGM404: Mobile originated packet access - B

Description:

MS class B.  
net mode II.  
IMSI attached.

The MS tries to allocate a PDCH but no valid IA is received before T3146 expires.

Preamble:

MGM

(RR 1)

RR starts timer T3146 after sending the last random burst.

(RR 2)

RR receives Immediate Assignment message with a wrong request reference. This Immediate Assignment is ignored.

(RR 3)

RR receives no Immediate Assignment.

(RR 4)

If RR receives no Immediate Assignment message it could also be that only 2<sup>nd</sup> part of a two message Immediate Assignment was not received because PL handles the correct reception of a TMA and sends only the relevant parts to RR.

(RR 5)

If the Packet Access Timer T3146 expires GRR is informed via the RRGR\_STOP\_CHANNEL\_IND and RR starts a cell reselection.

History:

12-Apr-00

## Packet Paging using CCCH

### MGM407: Mobile terminated packet access – B??

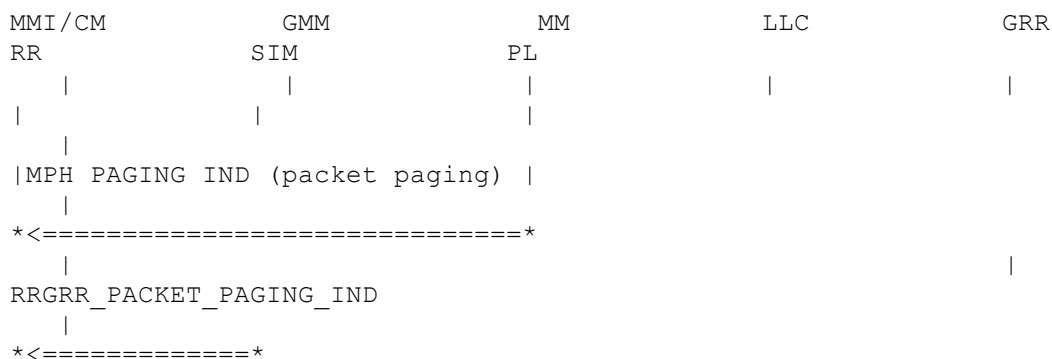

Description: (under construction/DG 25.7.2000)

MS class B  
net mode II.  
IMSI attached.

The MS receives packet paging on CCCH. RR informs GRR.

Preamble:

MGM

## Cell Response Procedure

1. GMM has to response to GMMRR\_CELL\_IND finally with GMMRR\_CELL\_RES.
2. GMM may receive more than one GMMRR\_CELL\_IND before responding with GMMRR\_CELL\_RES.
3. If LLC is suspended with LLGMM\_RAU LLC should at least the first time send GRR\_SUSPEND\_REQ to GRR to ask GRR for GRR\_SUSPEND\_READY\_IND.
4. Upon receiving GMMRR\_CELL\_RES GRR should send GMMRR\_READY\_IND instead of GMMRR\_SUSPEND\_READY\_IND.
5. Upon receiving LLGMM\_RESUME\_REQ LLC should listen to GMMRR\_READY\_IND instead of GMMRR\_SUSPEND\_READY\_IND.
6. If LLC is in supended state it should expect LLGMM\_SUSPEND\_REQ if cause is changed, i.e. if the cause changed to LLGMM\_RAU.
7. LLC should not send GRR\_SUSPEND\_REQ to GRR on causes different from LLGMM\_RAU.

### 5.6.4 MGM800: Normal Cell Change

Description:

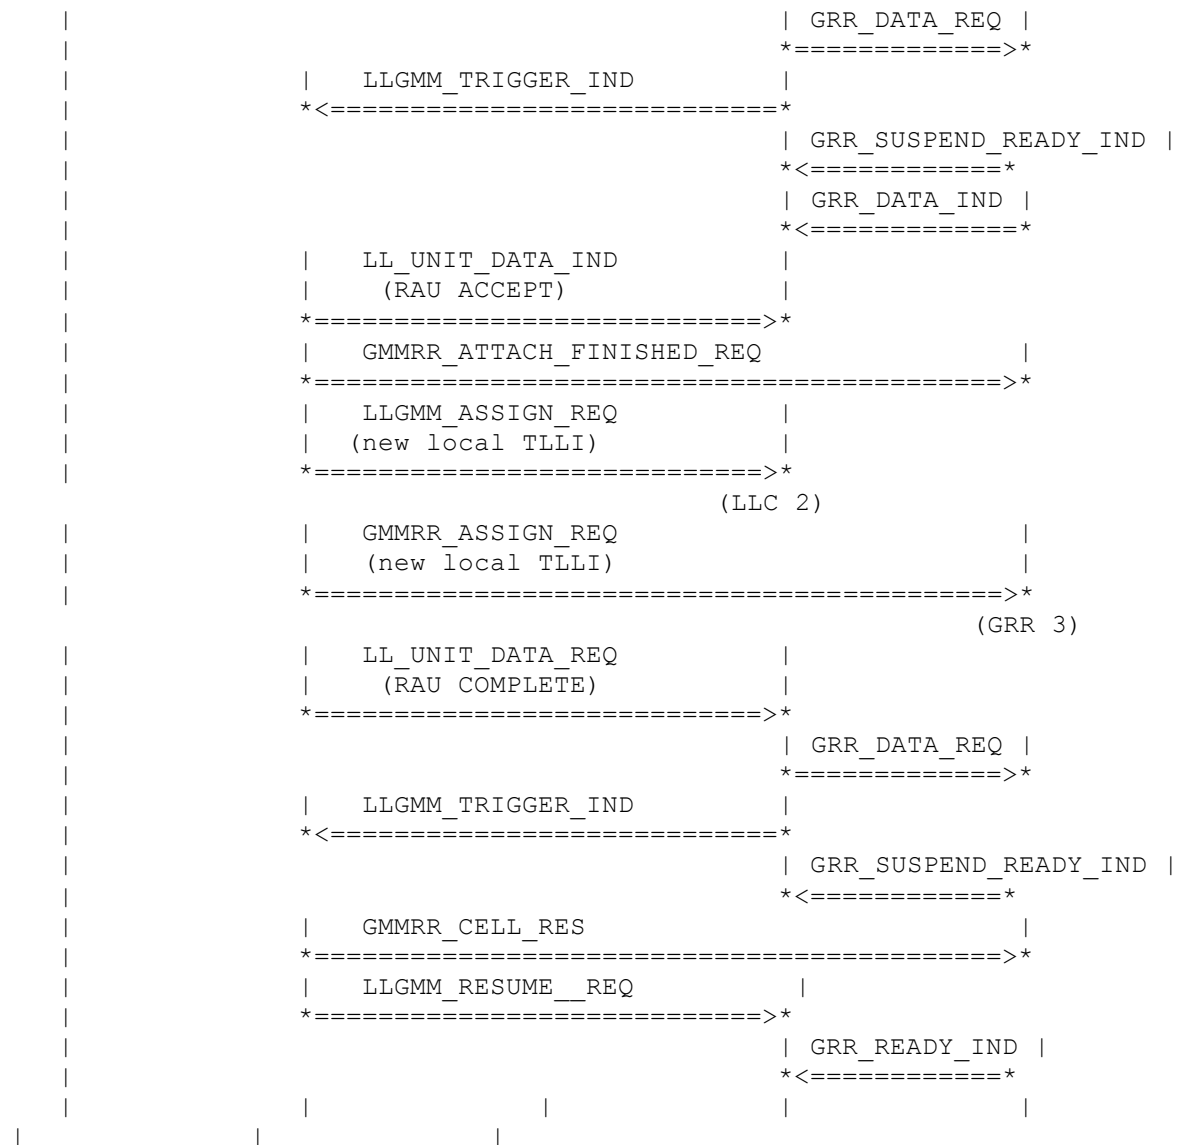

MS class B.  
For normal cell changes LLC is not suspended. GMM responses immediately with GMMRR\_CELL\_RES.

Preamble:

none

Texas Instruments Proprietary Information – Internal Data
Page 68 of 77

(GMM 1)  
GRR sends cell ind and the RAU is crossed.

(LLC 1)  
LLC is suspended. LLC has to inform GRR.

(GRR 1/2)  
GRR switches to GMM queue and sends GRR\_SUSPEND\_READY to LLC.

(LLC 2/GRR3)  
Foreign TLLI is assigned to the mobile

## 5.6.7 MGM803: Periodic RAU is interrupted by RAU change

Description:

MS class B.

Routing area update should be done, but no cell is changed. LLC is suspended with different cause than LLGMM\_RAU. LLC must not suspend GRR. If RAU is finished LLC is resumed by GMM. RAU procedure is interrupted by RA change. GMM requests LLC to suspend GRR via LLGMM\_SUSPEND\_REQ (LLGMM\_RAU). RAU is reinitialized and restarted. When RAU is finished GRR is informed via GMMR\_CELL\_RES and LLC is resumed.

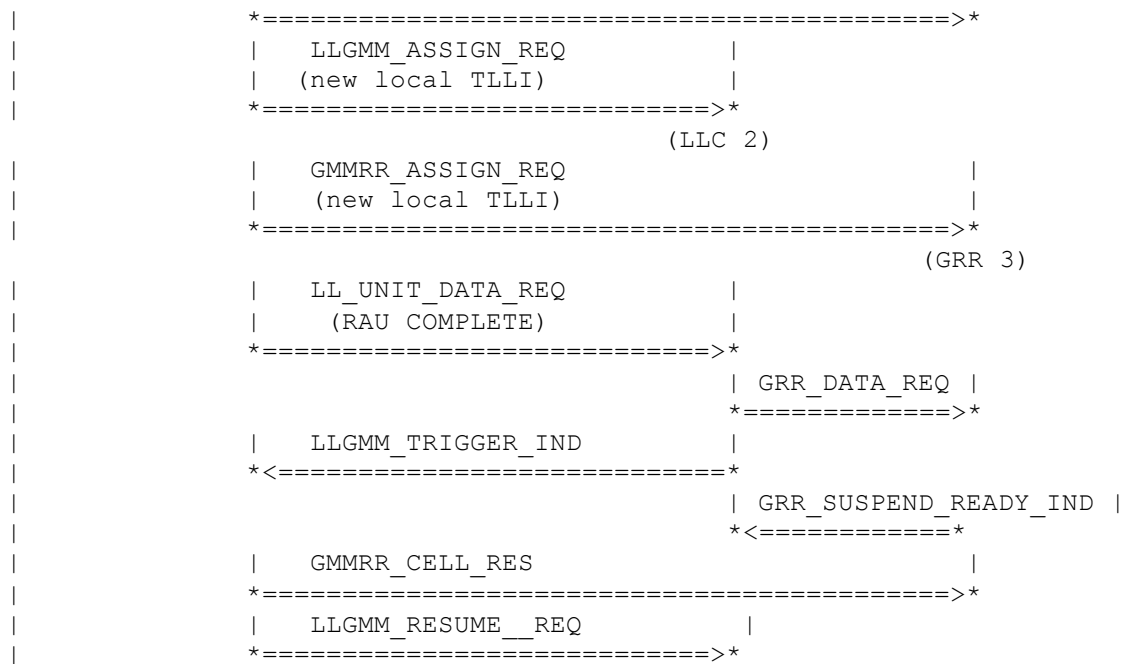

Preamble:

none

**DS-WCDMA** Direct Sequence/Spread Wideband Code Division Multiple Access

### B. Glossary

**International Mobile Telecommunication 2000 (IMT-2000/ITU-2000)** Formerly referred to as FPLMTS (Future Public Land-Mobile Telephone System), this is the ITU's specification/family of standards for 3G. This initiative provides a global infrastructure through both satellite and terrestrial systems, for fixed and mobile phone users. The family of standards is a framework comprising a mix/blend of systems providing global roaming. <URL: <http://www.imt-2000.org/>>
