2.5	Structures.....	41
2.6	Bitbuffer.....	77
<b>3</b>	<b>TEST CASES .....</b>	<b>79</b>
3.1	Setup.....	79
3.1.1	RRG000: Setup the routing and PCO view for the RR test.....	79
3.2	Cell Selection (100).....	80
3.2.1	RRG101: Activation And Cell Selection.....	80
3.2.2	RRG102: GPRS Indication - Going to IDLE-Mode.....	84
3.2.3	RRG103: Cell Selection – SI13 on EBCCCH .....	87
3.2.4	RRG104: Cell Selection – GPRS possible but not wanted .....	92
3.2.5	RRG105: Cell Selection – limited service.....	96
3.2.6	RRG106: GPRS Indication - Going to IDLE-Mode PBCCCH.....	100
3.3	Packet Idle Mode Procedures (200).....	106
3.3.1	RRG201: Listening to Neighbour Cell .....	106
3.3.2	RRG202: Updating System Information .....	109
3.3.3	RRG203: Reselection no GPRS.....	111
3.3.4	RRG204: Cell reselection (start).....	112
3.3.5	RRG205: Cell reselection (completion) - the new cell supports GPRS .....	115
3.3.6	RRG206: Cell reselection (completion) - the new cell doesn't support GPRS .....	119
3.3.7	RRG210: Extended Measurement initialisation .....	121
3.3.8	RRG212: Extended Measurement type 1 completion .....	123
3.3.9	RRG213: Extended Measurement type 1 completion (short list) .....	125
3.3.10	RRG214: Extended Measurement type 2 completion (short result) .....	127
3.3.11	RRG215: Extended Measurement type 2 completion (full result) .....	130
3.3.12	RRG216: Extended Measurement type 2 completion (short list) .....	133
3.3.13	RRG217: Extended Measurement type 3 completion .....	135
3.3.14	RRG220: Extended Measurement - premature end (early) .....	136
3.3.15	RRG221: Extended Measurement - premature end (middle) .....	137
3.3.16	RRG222: Extended Measurement - premature end (late) .....	139
3.3.17	RRG225: Extended Measurement interruption by cell reselection (preparation) .....	141
3.3.18	RRG226: Extended Measurement interruption by cell reselection (early).....	142
3.3.19	RRG227: Extended Measurement interruption by cell reselection (middle) .....	144
3.3.20	RRG228: Extended Measurement interruption by cell reselection (late) .....	146

3.3.21	RRG230: Extended Measurement request while in cell reselection .....	149
3.3.22	RRG248: Ncell Synchronization requests from GRR in PIM_PBCCH, empty .....	150
3.3.23	RRG249: Ncell Synchronization requests from GRR in PIM_PBCCH, full .....	151
3.3.24	RRG250: Ncell Synchronization requests from GRR in PIM_PBCCH .....	152
3.3.25	RRG251: RRGR_RR_CR_REQ (CR_NEW) .....	153
3.3.26	RRG252: RRGR_RR_CR_REQ (CR_NEW_NOT_SYNCED) .....	154
3.3.27	RRG253: RRGR_RR_SYNC_REQ .....	155
3.3.28	RRG254: RRGR_RR_CR_REQ (CR_NEW) followed by CR_CS .....	156
3.3.29	RRG261: Start by MM for full service (HPLMN), successful, with bcch info .....	157
3.3.30	RRG262: Restart by RR for full service (HPLMN) is successful .....	162
3.3.31	RRG263: Restart by RR for full service (HPLMN) fails .....	169
3.3.32	RRG264: Start by MM for full service, successful, with bcch info, with PBCCH .....	170
3.3.33	RRG265: Restart by RR for full service (HPLMN) is successful, PBCCH .....	174
3.3.34	RRG266: Restart by RR for full service (HPLMN) fails .....	181
<b>3.4</b>	<b>Packet Paging (300) .....</b>	<b>183</b>
3.4.1	RRG301: RRGR_PACKET_PAGING_IND .....	183
3.4.2	RRG302: Channel Request after Paging – IA failed .....	185
3.4.3	RRG304: Channel Request after Paging – IA success .....	186
<b>3.5</b>	<b>Packet Access (400) .....</b>	<b>187</b>
3.5.1	RRG401: Immediate assignment for PDCH / success .....	187
3.5.2	RRG402: Immediate assignment for SDCCH / success .....	190
3.5.3	RRG405: Two-message assignment .....	195
3.5.4	RRG406: Immediate Assignment not received .....	197
3.5.5	RRG407: Wrong immediate assignment received .....	198
3.5.6	RRG408: Immediate assignment is incomplete .....	200
3.5.7	RRG409: Immediate assignment – RLC/MAC failure .....	202
3.5.8	RRG410: Immediate assignment rejection .....	202
3.5.9	RRG411: Immediate assignment for SDCCH fails .....	204
3.5.10	RRG412: Packet Access with PBCCH .....	206
3.5.11	RRG413: new ncell list in PAM, PBCCH .....	206
3.5.12	RRG414: Left Blank 2 .....	208
3.5.13	RRG415: Two-message assignment fails .....	209
<b>3.6</b>	<b>Packet Downlink Assignment Procedure (500) .....</b>	<b>211</b>
3.6.1	RRG501: Downlink assignment .....	211
3.6.2	RRG502: Two-message downlink assignment .....	213
<b>3.7</b>	<b>Dedicated Mode Procedures related to GPRS (600) .....</b>	<b>216</b>
3.7.1	RRG601: DL_ESTABLISH_REQ (RR_Init) .....	216
3.7.2	RRG602: RRGR_DATA_IND .....	217
3.7.3	RRG605: RRGR_PACKET_PAGING_IND .....	219
3.7.4	RRG610: Start of PDCH Assignment in dedicated mode .....	220
3.7.5	RRG620: Receive of PDCH Assignment .....	223
3.7.6	RRG622: PDCH Assignment: GRR suspends the dedicated mode .....	225
3.7.7	RRG624: PDCH Assignment: GRR stops monitoring - PBCCH present .....	226
3.7.8	RRG625: PDCH Assignment: GRR stops monitoring - No PBCCH present .....	227
3.7.9	RRG626: PDCH Assignment: GRR indicates establishment of TBF .....	228
3.7.10	RRG628: PDCH Assignment: GRR indicates release of TBF .....	230
3.7.11	RRG630: PDCH Assignment: GRR may not accept PDCH assignment .....	231
3.7.12	RRG632: PDCH Assignment: Timeout during TBF establishment .....	232

### 0.3 Abbreviations

AGCH	Access Grant Channel
AT	Attention sequence "AT" to indicate valid commands of the ACI
BCCH	Broadcast Control Channel
BS	Base Station
BSIC	Base Station Identification Code
C/R	Command/Response
C1	Path Loss Criterion
C2	Reselection Criterion
CBCH	Cell Broadcast Channel
CBQ	Cell Bar Qualify
CC	Call Control
CCCH	Common Control Channel
CCD	Condat Coder Decoder
CHAP	Challenge Handshake Authentication Protocol
CKSN	Ciphering Key Sequence Number
CRC	Cyclic Redundancy Check
DCCH	Dedicated Control Channel
DCOMP	Identifier of the user data compression algorithm used for the N-DPU
DISC	Disconnect Frame
DL	Data Link Layer
DM	Disconnected Mode Frame
DTX	Discontinuous Transmission
E	Extension bit
EA	Extension Bit Address Field
EL	Extension Bit Length Field
EMMI	Electrical Man Machine Interface
F	Final Bit
FACCH	Fast Associated Control Channel
FHO	Forced Handover
GACI	GPRS AT Command Interpreter
GMM	GPRS Mobility Management
GP	Guard Period
GRR	GPRS RR
GSM	Global System for Mobile Communication
HDLC	High-level Data Link Control
HISR	High level Interrupt Service Routine
HPLMN	Home Public Land Mobile Network
I	Information Frame
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
IP	Internet Protocol
IPCP	Internet Protocol Control Protocol
ITU	International Telecommunication Union
IWF	Interworking Function
Kc	Ciphering Key
L	Length Indicator
LAI	Location Area Information

LCP	Link Control Protocol
LISR	Low level Interrupt Service Routine
LLC	Logical Link Control
LPD	Link Protocol Discriminator
LQM	Link Quality Monitoring
M	More bit used to indicate the last segment of N-DPU
MAC	Medium Access Control
MCC	Mobile Country Code
MM	Mobility Management
MMI	Man Machine Interface
MNC	Mobile Network Code
MS	Mobile Station
MT	Mobile Termination
N(R)	Receive Number
N(S)	Send Number
NC	Network Control
NCC	National Colour Code
NCP	Network Control Protocol
NECI	New Establishment Causes included
N-PDU	Network Protocol Data Unit
NSAPI	Network Layer Service Access Point Identifier
OTD	Observed Time Difference
P	Poll Bit
P/F	Poll/Final Bit
PACCH	Packet Associated Control Channel
PAP	Password Authentication Protocol
PBCCH	Packet BCCH
PCCCH	Packet CCCH
PCOMP	Identifier of the protocol control information compression algorithm used for the N-DPU
PDCH	Packet Data Channel
PDP	Packet Data Protocol e.g. IP or X.25
PDTCH	Packet Data Traffic Channel
PRACH	Packet RACH
PSI	Packet System Information
PCH	Paging Channel
PCO	Point of Control and Observation
PDU	Protocol Data Unit
PL	Physical Layer
PLMN	Public Land Mobile Network
PPC	Packet Physical Convergence
PPP	Point-to-Point Protocol
PTP	Point to Point
QoS	Quality of Service
RACH	Random Access Channel
REJ	Reject Frame
RLC	Radio Link Control
RNR	Receive Not Ready Frame
RR	Radio Resource Management
RR	Receive Ready Frame
RTD	Real Time Difference
RTOS	Real Time Operating System

SABM	Set Asynchronous Balanced Mode
SACCH	Slow Associated Control Channel
SAP	Service Access Point
SAPI	Service Access Point Identifier
SDCCH	Stand alone Dedicated Control Channel
SDU	Service Data Unit
SGSN	Serving GPRS Support Node
SIM	Subscriber Identity Module
SM	Session Management
SMS	Short Message Service
SMSCB	Short Message Service Cell Broadcast
SNDCP	Subnetwork Dependant Convergence Protocol
SNSM	SNDCP-SM
SS	Supplementary Services
TAP	Test Application Program
TBF	Temporary Block Flow
TCH	Traffic Channel
TCH/F	Traffic Channel Full Rate
TCH/H	Traffic Channel Half Rate
TCP	Transmission Control Protocol
TDMA	Time Division Multiple Access
TE	Terminal Equipment - e. g. a PC
TFI	Temporary Flow Identifier
TLLI	Temporary Logical Link Identifier
TMSI	Temporary Mobile Subscriber Identity
TOM	Tunnelling of Messages
TQI	Temporary Queuing Identifier
UA	Unnumbered Acknowledgement Frame
UART	Universal Asynchronous Receiver Transmitter
UI	Unnumbered Information Frame
USF	Uplink State Flag
V(A)	Acknowledgement State Variable
V(R)	Receive State Variable
V(S)	Send State Variable
VPLMN	Visited Public Land Mobile Network

## 0.4 Terms

Entity:	Program which executes the functions of a layer
Message:	A message is a data unit which is transferred between the entities of the same layer (peer-to-peer) of the mobile and infrastructure side. Message is used as a synonym to protocol data unit (PDU). A message may contain several information elements.
Primitive:	A primitive is a data unit which is transferred between layers on one component (mobile station or infrastructure). The primitive has an operation code which identifies the primitive and its parameters.
Service Access Point	A Service Access Point is a data interface between two layers on one component (mobile station or infrastructure).

## 1 Overview

The Protocol Stacks are used to define the functionality of the GSM protocols for interfaces. The GSM specifications are normative when used to describe the functionality of interfaces, but the stacks and the subdivision of protocol layers does not imply or restrict any implementation.

The protocol stack for GPRS consists of several entities. Each entity has one or more service access points, over which the entity provides a service for the upper entity.

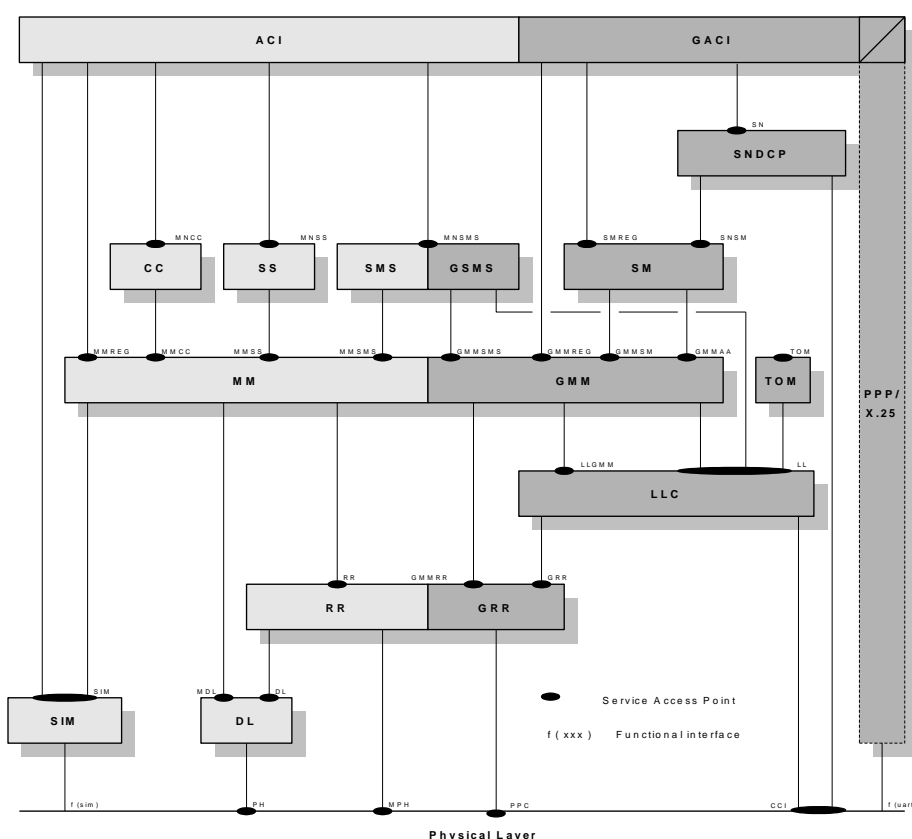

Figure 1-1: Architecture of the GSM/GPRS protocol stack

The information units passed via the SAPs are called primitives and consists of an operation code and several parameters. See the Users Guide for details.

The entities of the GPRS protocol stack are:

### 1.1 GRR (RLC/MAC) – Radio Link Control/Medium Access Control

This layer contains two functions: The Radio Link Control function provides a radio-solution-dependent reliable link. The Medium Access Control function controls the access signalling (request and grant) procedures for the radio channel, and the mapping of LLC frames onto the GSM physical channel.

---

## 1.2 LLC – Logical Link Control

The LLC entity provides multiple highly reliable logical links for asynchronous data transfer between the MS and the network. It supports variable-length information frames, acknowledged and unacknowledged data transfer, flow and sequence control, error detection and recovery, notification of unrecoverable errors, user identity confidentiality, and ciphering of user and signaling data.

## 1.3 GMM – GPRS Mobility Management

The GMM entity provides procedures for the mobility of the MS, such as informing the network of its present location, and user identity confidentiality. It manages the GMM context (attach, detach, routing area updating), supports security functions such as authentication of user and MS, controls ciphering of data, and initiates the response to paging messages.

## 1.4 SM – Session Management

The main function of the session management (SM) is to support PDP context handling of the user terminal. Session Management activates, modifies and deletes the contexts for packet data protocols (PDP). Session Management services are provided at the SMREG-SAP and the SNSM-SAP for anonymous and non-anonymous access. The non-anonymous and anonymous access procedures for PDP context activation and PDP context deactivation are available at the SMREG-SAP. In addition there exists a PDP context modification for non-anonymous PDP contexts.

## 1.5 SNDCP - Subnetwork Dependant Convergence Protocol

SNDCP carries out all functions related to transfer of Network layer Protocol Data Units (N-PDUs) over GPRS in a transparent way. SNDCP helps to improve channel efficiency by means of compression techniques. The set of protocol entities above SNDCP consists of commonly used network protocols. They all use the same SNDCP entity, which then performs multiplexing of data coming from different sources to be sent using the service provided by the LLC layer.

## 1.6 GACI – GPRS AT Command Interpreter

The ACI is the GPRS extension of the ACI. It is specified in GSM 07.60. It is responsible for processing of the GPRS related AT Commands to setup, activate and deactivate the PDP context parameter. It also provides functionality for the interworking between GMM/SM/SNDCP and a packet oriented protocol like PPP.

## 1.7 USART - Universal Synchronous Asynchronous Receiver Transmitter Driver

The USART is a hardware component that facilitates a connection between the mobile station and terminal equipment (e.g. a PC). This interface uses some of the circuits described in V.24.

The data exchange provided by this unit is serial and asynchronous (synchronous communication is not in the scope of this document). A driver that uses interrupts to manage a circular buffer for the sending and receiving direction is necessary in order to use this component in the GPRS. The driver has to be able to perform flow control.

## 1.8 TOM – Tunnelling of Messages

The TOM entity is present if and only if HS136 is supported (the feature flag FF\_HS136 is enabled).

The main function of TOM is to tunnel non-GSM signalling messages between the MS and the SGSN. The only non-GSM signalling which is currently supported by TOM is for the EGPRS-136 system (according to IS-136-376). Data transfer in both uplink and downlink direction is possible. Two different priorities (high, low) of signalling data transfer are supported. TOM uses the unacknowledged mode of LLC and the acknowledged mode of GRR (RLC/MAC).

## 3.2.2 RRG102: GPRS Indication - Going to IDLE-Mode

### Description:

RR has all necessary information to go to IDLE-Mode. After reaching IDLE, RR informs MM and GRR. RR sends RRGRR\_GPRS\_IND to GRR. This indication is used by RR to inform the GRR if the GPRS service is supported in the serving cell. RR also forwards the received SI13 Message to GRR.

## 3.2.4 RRG104: Cell Selection – GPRS possible but not wanted

### Description:

RR is activated and starts cell selection. RR sends RRGRGRR\_GPRS\_IND to GRR. This indication is used by RR to inform the GRR if the GPRS service is supported in the serving cell.

Although the Serving Cell supports GPRS, RR sends a NO-GPRS primitive to GRR because MM did not request GPRS Service.

**3.2.5 RRG105: Cell Selection – limited service**

## Description:

RR is activated for Limited Service and with GPRS activated (which should actually not happen, but this is easier to test then doing a full service scan first and then selecting a limited service cell) and starts cell selection. RR sends a RRGRR\_GPRS\_IND to GRR.

## 3.2.6 RRG106: GPRS Indication - Going to IDLE-Mode PBCCH

### Description:

RR has all necessary information to go to IDLE-Mode. After reaching IDLE, RR informs MM and GRR. RR sends RRGRR\_GPRS\_IND to GRR. This indication is used by RR to inform the GRR if the GPRS service is supported in the serving cell. RR also forwards the received SI13 Message to GRR.

### 3.3 Packet Idle Mode Procedures (200)

#### 3.3.1 RRG201: Listening to Neighbour Cell

Description:

Layer 1 sends a measurement report with a neighbour cell. RR starts listening to the neighbour cell. First the channel 3 is read. After reading of system information type 3 message on report is waited and then channel 18 is requested.

Preamble:

RRG102

## 3.3.2 RRG202: Updating System Information

### Description:

The MS has to read the system information's every 30 seconds. If GPRS is supported (and SI13 is sent) only the SI13 has to be read every 30 seconds. The SI13 will be forwarded to GRR and according the CHANGE\_MARK GRR will request reading of the other SI's.

### Preamble:

RRG102

### 3.3.10 RRG214: Extended Measurement type 2 completion (short result)

Description:

The extended measurement procedure has been started. ALR responds with the sorted measurement values. Because of the report\_type of 2 the synchronisation and BSIC reading must be tried to search for the 6 strongest carriers with successful BSIC reading of required NCC. All carriers must be read due to failing synchronisation for some of them before sending the result to GRR.

Preamble:

### 3.3.20 RRG228: Extended Measurement interruption by cell reselection (late)

**Description:**

The extended measurement procedure has been started. ALR responds with the sorted measurement values and the BSIC synchronization is performed. When RR erequest to stop the procedure, ALR sends a measurement indication, which triggers a cell reselection. The extended measurement procedure is stopped and the cell reselection is started.

**Preamble:**

## 3.3.31 RRG263: Restart by RR for full service (HPLMN) fails

**Description:** MM has requested a full service search for the VPLMN in the HPLMN country and RR is in full service. After timeout of the registration timer RR starts the full service search for HPLMN. The search fails and the registration timer in RR is set to the HPLMN period from the SIM card.

**Preamble:** RRG261

### 3.3.32 RRG264: Start by MM for full service, successful, with bcch info, with PBCCH

**Description:** MM starts an attempt for full service for a visiting PLMN in the HPLMN country. The request contains BCCH information from the SIM card. The attempt is successful. The channel ARFCN\_20 shall be used. It is member of the BCCH information. It is expected that the registration timer in RR for searching the HPLMN is started with 2 Minutes.

## 3.3.34 RRG266: Restart by RR for full service (HPLMN) fails

**Description:** MM has requested a full service search for the VPLMN in the HPLMN country and RR is in full service. After timeout of the registration timer RR starts the full service search for HPLMN. The search fails and the registration timer in RR is set to the HPLMN period from the SIM card.

**Preamble:** RRG264

## 3.4 Packet Paging (300)

### 3.4.1 RRG301: RRGRR\_PACKET\_PAGING\_IND

**Description:**

The MS is in the idle mode camping on a cell. The MS is paged by a packet paging message. This message may contain a paging request type 1,2 or 3. Further the message indicates whether the paging type was IMSI or P-TMSI (GPRS TMSI).  
 Pagings will only be accepted if there was at least one successful measurement.  
 The immediate assignment procedure is started.  
 A Paged by PTMSI  
 B Paged by TMSI  
 C Paged by IMSI

**Preamble:**

RRG102

**Variants:**

<A>..<C>

### 3.4.2 RRG302: Channel Request after Paging – IA failed

**Description:**

The MS requests a channel assignment after being paged.  
The immediate assignment can not be finished because there is no channel assignment from network. After timeout a RRGR\_RR\_CR\_IND is sent to GRR and a cell selection is performed (because an cell reselection fails).

**Preamble:**

RRG301A

**Parametrization**

## 3.5 Packet Access (400)

### 3.5.1 RRG401: Immediate assignment for PDCH / success

Description:

RR is in the idle mode. GRR requests the establishment of a PDCH using the CCCH.

(RR 1): RR receives the channel request from GRR. RR starts the access procedure on the CCCH. RR does not need to check if there is a call active (GMM/GRR know this) or if the access is allowed (also checked by GRR). The wait indication (T3122) needs not to be checked for packet access and T3142 is checked by GRR.

(RR 2): T3146 is started after sending all random bursts. T3146 uses T3126 (the GSM equivalent) as they are the same.

(RR 3): On receipt of an Immediate Assignment message RR checks if the Message is either a TBF or dedicated mode assignment (If the Immediate Assignment message was part of a TMA (two message assignment) is by from RR, as PL handles the TMA and sends only the relevant part to RR). RR checks if the IA is valid by comparing the random access reference. For a valid TBF assignment RR informs GRR via the RRGRRA\_IND (there is also only 1 RRGRRA\_IND for a two message assignment with all the relevant parts merged). For a dedicated mode assignment RR sends a RRGRRA\_IND if GRR requested a channel else the normal RR procedures are used. T3146 is stopped on receipt of a valid IA.

Preamble:

## 3.5.6 RRG407: Wrong immediate assignment received

### Description:

RR is in the idle mode. GRR requests the establishment of a PDCH. The Immediate Assignment procedure fails because only immediate assignment messages are received which have a wrong request reference. Such messages are ignored. After expiry of T3126 GRR is informed, that the immediate assignment procedure has failed. GRR requests a cell reselection. Because there are no suitable neighbour cells a cell selection is started.

### Preamble:

### 3.7.6 RRG622: PDCH Assignment: GRR suspends the dedicated mode

**Description:**

The MS is in dedicated mode and had forwarded a PDCH Assignment message to GRR. GRR requests the suspension of dedicated mode. After RR has sent an RRGRR\_SUSPEND\_DCCH\_CNF GRR will try to establish a TBF.

**Preamble:**

RRG620

**Parametrization**

Primitive	Parameter	Value
(1) RRGRR_SUSPEND_DCCH_REQ		
(2) DL_SUSPEND_REQ		
	ch_type	CH_TYPE_SDCCH
	sapi	SAPI_0
(3) MPH_DEDICATED_REQ

(5) RRGRR_SUSPEND_DCCH_CNF		

**History:**

08-Aug-2001	LG	Initial
26-Feb-02	OT	Adaptations for AMR implementation

**3.7.7 RRG624: PDCH Assignment: GRR stops monitoring - PBCCH present**

## Description:

The MS is in dedicated mode and had forwarded a PDCH Assignment message to GRR. GRR had requested the suspension of dedicated mode. Before GRR tries to establish a TBF it will stop the monitoring of CCCH.

## Preamble:

RRG622

**Parametrization**

Primitive	Parameter	Value
(1) RRGRR_STOP_MON_CCCH_REQ	is_pbcch_present	TRUE
(2) MPH_MON_CTRL_REQ	action	STOP_MON_CCCH
	si_to_read	UNSPECIFIED_SI

## History:

13-Aug-2001	LG	Initial
-------------	----	---------

### 3.7.9 RRG626: PDCH Assignment: GRR indicates establishment of TBF

Description:

After receive of PDCH Assignment in dedicated mode and suspending the dedicated mode GRR has successfully established a TBF. Now GRR indicates the establishment. Therefore RR discards the old channel configuration.

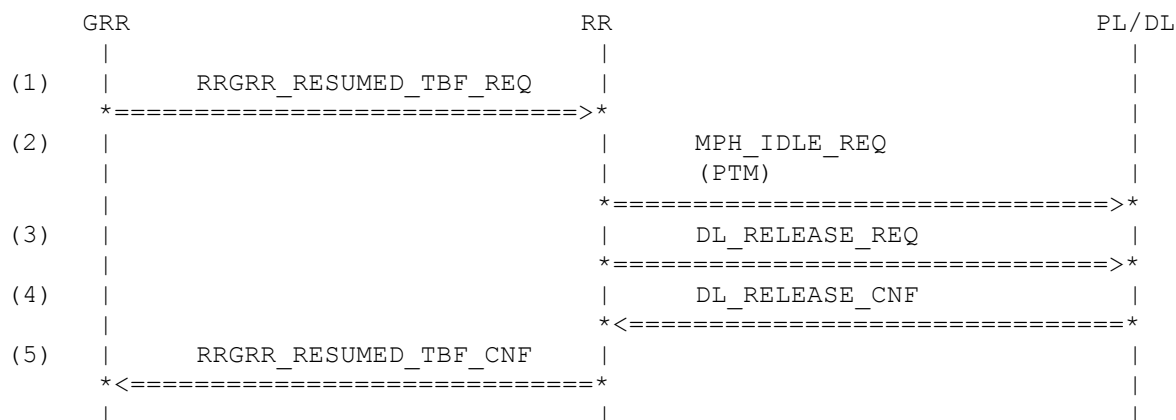

Variants:

<A>...<B>

Preamble:

<A>RRG624

<B>RRG625

## Parametrization

Primitive	Parameter	Value

## 3.9.3 RRG803: RRGRR\_ACTIVATE\_REQ – MO CS Call – with suspension request

### Description:

Mobile originated circuit-switched call  
For a class B mobile with an active downlink TBF the GPRS part has to be suspended to make a CS call.  
This primitive activates RR. RR acts as if the MS is only GSM service mobile. Monitor CCCH and BCCH.

### Preamble:
