

**DATA SHEET**

# SKY77324: iPAC™ PAM for Quad-Band GSM / GPRS

**Applications**

- Quad-band cellular handsets encompassing
  - Class 4 GSM850/900
  - Class 1 DCS1800 PCS1900
  - Class 12 GPRS multi-slot operation

**Features**

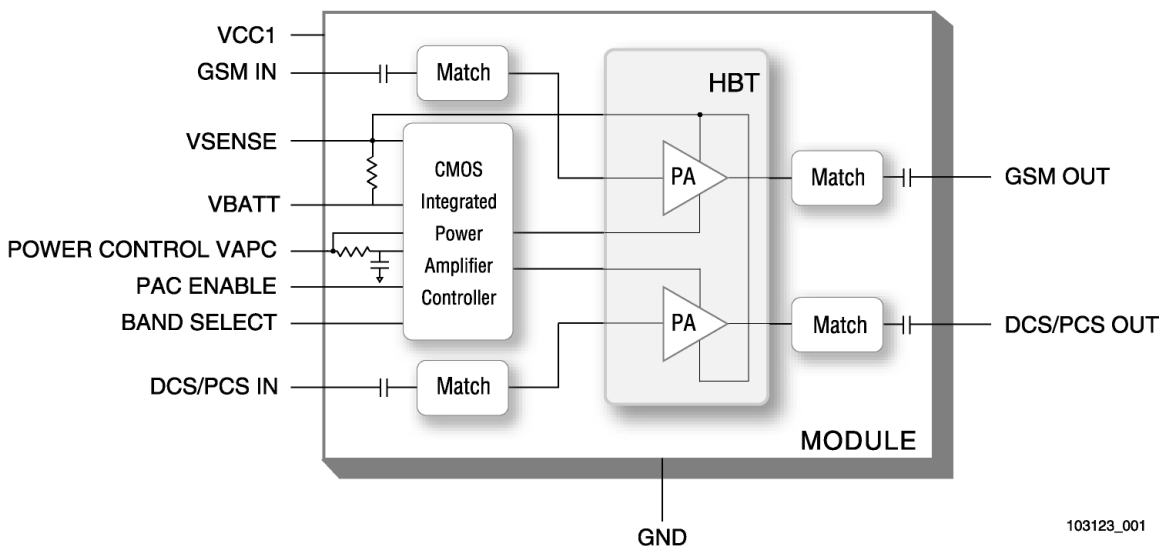

- Low input power range 0 to 6 dBm
- High efficiency
  - GSM850 49%
  - GSM900 53%
  - DCS 53%
  - PCS 53%
- Internal I<sub>cc</sub> sense resistor for PAC
- Closed loop iPAC or open loop operation with external PAC circuit
- Input/Output matching 50 Ω internal (with DC blocking)
- 22-pin package
  - Small outline 6 mm x 8 mm
  - Low profile 1.2 mm maximum
- Low APC current 20 μA
- Gold plated, lead-free contacts

The SKY77324 Power Amplifier Module (PAM) is designed in a low profile (1.2 mm), compact form factor for quad-band cellular handsets comprising GSM850/900, DCS1800, and PCS1900 operation. The PAM also supports Class 12 General Packet Radio Service (GPRS) multi-slot operation.

The module consists of separate GSM850/900 PA and DCS1800/PCS1900 PA blocks, impedance-matching circuitry for 50 Ω input and output impedances, and a Power Amplifier Control (PAC) block with an internal current-sense resistor. The custom CMOS integrated circuit provides the internal PAC function and interface circuitry. Fabricated onto a single Gallium Arsenide (GaAs) die, one Heterojunction Bipolar Transistor (HBT) PA block supports the GSM850/900 bands and the other supports the DCS1800 and PCS1900 bands. Both PA blocks share common power supply pins to distribute current. The GaAs die, the Silicon (Si) die, and the passive components are mounted on a multi-layer laminate substrate. The assembly is encapsulated with plastic overmold.

RF input and output ports of the SKY77324 are internally matched to a 50 Ω load to reduce the number of external components for a quad-band design. Extremely low leakage current (2.5 μA, typical) of the dual PA module maximizes handset standby time. The SKY77324 also contains band-select switching circuitry to select GSM (logic 0) or DCS/PCS (logic 1) as determined from the Band Select (BS) signal. In Figure 1, below, the BS pin selects the PA output (DCS/PCS OUT or GSM850/900 OUT) and the Analog Power Control (VAPC) controls the level of output power.

VBATT and VSENSE pins connect to an internal current-sense resistor and interface to an integrated power amplifier control (iPAC™) function, which is insensitive to variations in temperature, power supply, and process. The PAC ENABLE input allows initial turn-on of PAC circuitry to minimize battery drain.

**Figure 1. Functional Block Diagram**

**Electrical Specifications**

The following tables list the electrical characteristics of the SKY77324 Power Amplifier Module. [Table 1](#) lists the absolute maximum ratings and [Table 2](#) shows the recommended operating conditions. [Table 3](#) lists the electrical characteristics of the SKY77324 for modes GSM850, GSM900, DCS1800, and PCS1900.

[Figure 2](#) is a diagram of a typical SKY77324 application.

The SKY77324 is a static-sensitive electronic device and should not be stored or operated near strong electrostatic fields. Detailed information on device dimensions, pin descriptions, packaging and handling can be found in later sections of this data sheet.

**Table 1. Absolute Maximum Ratings**

Parameter	Minimum	Maximum	Unit
Input Power (P <sub>IN</sub> )	—	15	dBm
Supply Voltage (V <sub>CC</sub> ), Standby, V <sub>APC</sub> ≤ 0.3 V, PAC ENABLE ≤ 0.2 V	—	7	V
Control Voltage (V <sub>APC</sub> )	-0.5	V <sub>CC_MAX</sub> - 0.2 (See <a href="#">Table 3</a> )	V
Storage Temperature	-55	+100	°C

**Table 2. Recommended Operating Conditions**

Parameter	Minimum	Typical	Maximum	Unit
Supply Voltage (V <sub>CC</sub> )	2.9	3.5	4.8V <sup>(1)</sup>	V
Supply Current (I <sub>CC</sub> )	0	—	2.5 <sup>(1)</sup>	A
Operating Case Temperature (T <sub>CASE</sub> ) – Package Bottom Surface				
1-Slot (12.5% duty cycle)	-20	—	+100	°C
2-Slot (25.0% duty cycle)	-20	—	+100	
3-Slot (37.5% duty cycle)	-20	—	+85	
4-Slot (50.0% duty cycle)	-20	—	+85	

<sup>(1)</sup> In open loop operation: For charging conditions with V<sub>CC</sub> > 4.8 V, derate I<sub>CC</sub> linearly down to 0.5 A, maximum, at V<sub>CC</sub> = 5.5 V.

**Table 3. SKY77324 Electrical Specifications** <sup>(1)</sup> (1 of 9)

Parameter	Symbol	Test Condition	Min.	Typ.	Max.	Units
<b>General</b>						
Supply voltage	V <sub>CC</sub>	—	2.9	3.5	4.8	V

 RL = 50 Ω  
 pulsed operation with pulse width ≤ 1154 μs and duty cycle ≤ 2:8  
 V<sub>CC</sub> = 2.9 V to 4.8 V.

<sup>(2)</sup> I<sub>CC</sub> = 0A to xA, where x = current at P<sub>OUT</sub> = 34.5 dBm, 50 Ω load, and V<sub>CC</sub> = 3.5 V.

<sup>(3)</sup> I<sub>CC</sub> = 0A to xA, where x = current at P<sub>OUT</sub> = 32.0 dBm, 50 Ω load, and V<sub>CC</sub> = 3.5 V.

<sup>(4)</sup> This device has an Open Loop mode that allows bypassing of the internal PAC circuitry. See the Technical Information section at end of this document for further information.

<sup>(5)</sup> Power control variation is measured by comparing power obtained at a specified control voltage over all conditions, against the power obtained with the same control voltage at nominal conditions. For this module, nominal conditions are defined as  
 T = 25 °C  
 V<sub>CC</sub> = 3.5 V  
 P<sub>IN</sub> = 3 dBm  
 Frequency = mid-band

**NOTES:**

1. The value of 33  $\mu$ F cap depends on the noise level on the phone board.
2. Depending on phone board noise level, not all 0402 and 0.01  $\mu$ F caps may be needed.
3. Ensure sufficient numbers of vias connect VBATT pin to battery trace.
4. VBATT trace should be  $\geq 1.0$  mm.
5. Ensure sufficient numbers of vias connect VCC1A, B, and C to battery trace.
6. VCC1A, B, and C trace widths should be  $\geq 0.25$  mm.
7. Ground terminals of all bypass caps are connected to ground plane with vias.
8. Dotted traces can be routed in the inner layers.

**Figure 2. Typical SKY77324 PAM Application**

**Package Dimensions and Pin Description**

Figure 3 is a mechanical diagram of the pad layout for the SKY77324, a 22-pin leadless quad-band PA module. Figure 4 provides a recommended phone board layout footprint for the PAM to help the designer attain optimum thermal conductivity, good grounding, and minimum RF discontinuity for the 50 Ω terminals.

Figure 5 shows the device pin configuration and Table 4 lists the pin names and signal descriptions. The pin numbering convention starts with pin 1 at the upper left, as indicated in Figure 5, and increments counter-clockwise around the package. Figure 6 interprets typical case markings.

NOTES: unless otherwise specified.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCES IN ACCORDANCE WITH ASME Y14.5M-1994.
3. PADS ARE METAL DEFINED; CENTER AND EDGE GROUND PAD ARE SOLDER MASK DEFINED

**Package and Handling Information**

Because of its sensitivity to moisture absorption, this device package is baked and vacuum-packed prior to shipment. Instructions on the shipping container label must be followed regarding exposure to moisture after the container seal is broken, otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

The SKY77324 is currently qualified for MSL3/240 °C. Demonstration of the SKY77324 to withstand an MSL3/250 °C solder reflow is pending completion of qualification tests.

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. If the part is attached in a reflow oven, the temperature ramp rate

should not exceed 5 °C per second; maximum temperature should not exceed 250 °C. If the part is manually attached, precaution should be taken to insure that the part is not subjected to temperatures exceeding 250 °C for more than 10 seconds.

For details on attachment techniques, precautions, and handling procedures recommended by Skyworks, please refer to *Application Note: PCB Design and SMT Assembly/Rework, Document Number 101752*. Additional information on standard SMT reflow profiles can also be found in the *JEDEC Standard J-STD-020B*.

Production quantities of this product are shipped in the standard tape-and-reel format. For packaging details, refer to *Application Note: Tape and Reel, Document Number 101568*.

### Electrostatic Discharge Sensitivity

The SKY77324 is a Class I device. Figure 7 lists the Electrostatic Discharge (ESD) immunity level for each pin of the SKY77324 module. The numbers specify the ESD threshold levels for each pin where the I-V curve between the pin and ground starts to show degradation.

ESD testing was performed in compliance with MIL-STD-883E

Method 3015.7 using the Human Body Model. If the magnitude of ESD damage threshold is found to consistently exceed 2000 volts, this so is indicated. If the ESD damage threshold below 2000 volts is measured for either polarity, numbers are indicated that represent worst case values observed in product characterization.

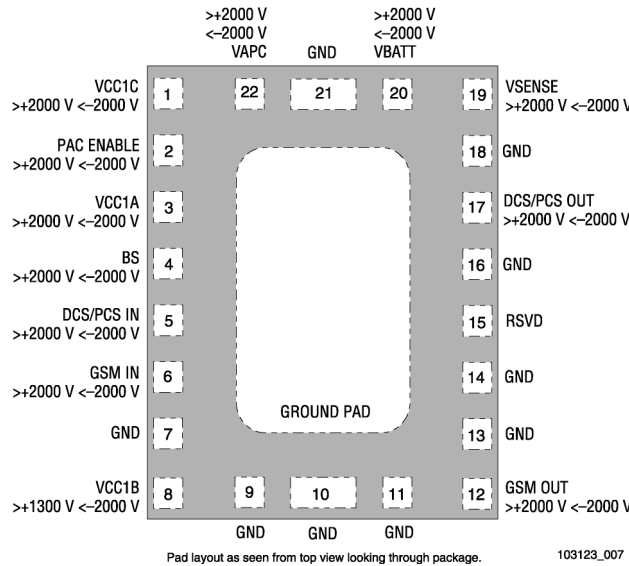

Figure 7. ESD Sensitivity Areas (Top View)

Various failure criteria can be utilized when performing ESD testing. Many vendors employ relaxed ESD failure standards, which fail devices only after “the pin fails the electrical specification limits” or “the pin becomes completely non-functional”. Skyworks’ most stringent criteria fail devices as soon

as the pin begins to show any degradation on a curve tracer. To avoid ESD damage, both latent and visible, it is very important that the product assembly and test areas follow the Class-1 ESD handling precautions listed in

Table 5.

## Technical Information

Closed loop control of the amplifier is enabled when PAC ENABLE is driven to logic high. The PA collector current will then be directly proportional to the  $V_{APC}$  input voltage over the range of 400 mV to 2.1 V.

To meet the GSM power versus time mask and switching transient requirements the PAM must be provided with a DAC ramp profile on the  $V_{APC}$  input as well as proper timing on digital controls for the PAC circuitry.

**Note:** *Please refer to 3GPP TS 51.010-1: Mobile Station (MS) conformance specification. All GSM specifications are now the responsibility of 3GPP. The standards are available at <http://www.3gpp.org>.*

The SKY77324 has been designed to comply with interface requirements and DAC resolution of leading base band devices. The ramp profile typically consists of a pedestal voltage, 10–16 discrete voltage steps on the rising edge of the burst, a constant region, 10–16 steps on the falling edge, and a final voltage. Typically, the user defines the start, stop, and 10–16 percentage values for each rising and falling edge, which are then applied as discrete voltages at the  $V_{APC}$  input. For the SKY77324, generally the same profile, scaled in amplitude, is used for all frequencies and power control levels. The ultimate purpose is to keep the RF output power ramp within the time mask and to maintain acceptable spectral limits at specified offset frequencies. The  $V_{APC}$  input has an internal reconstruction filter such that external resistors or capacitors are unnecessary on the phone board or the test fixture.

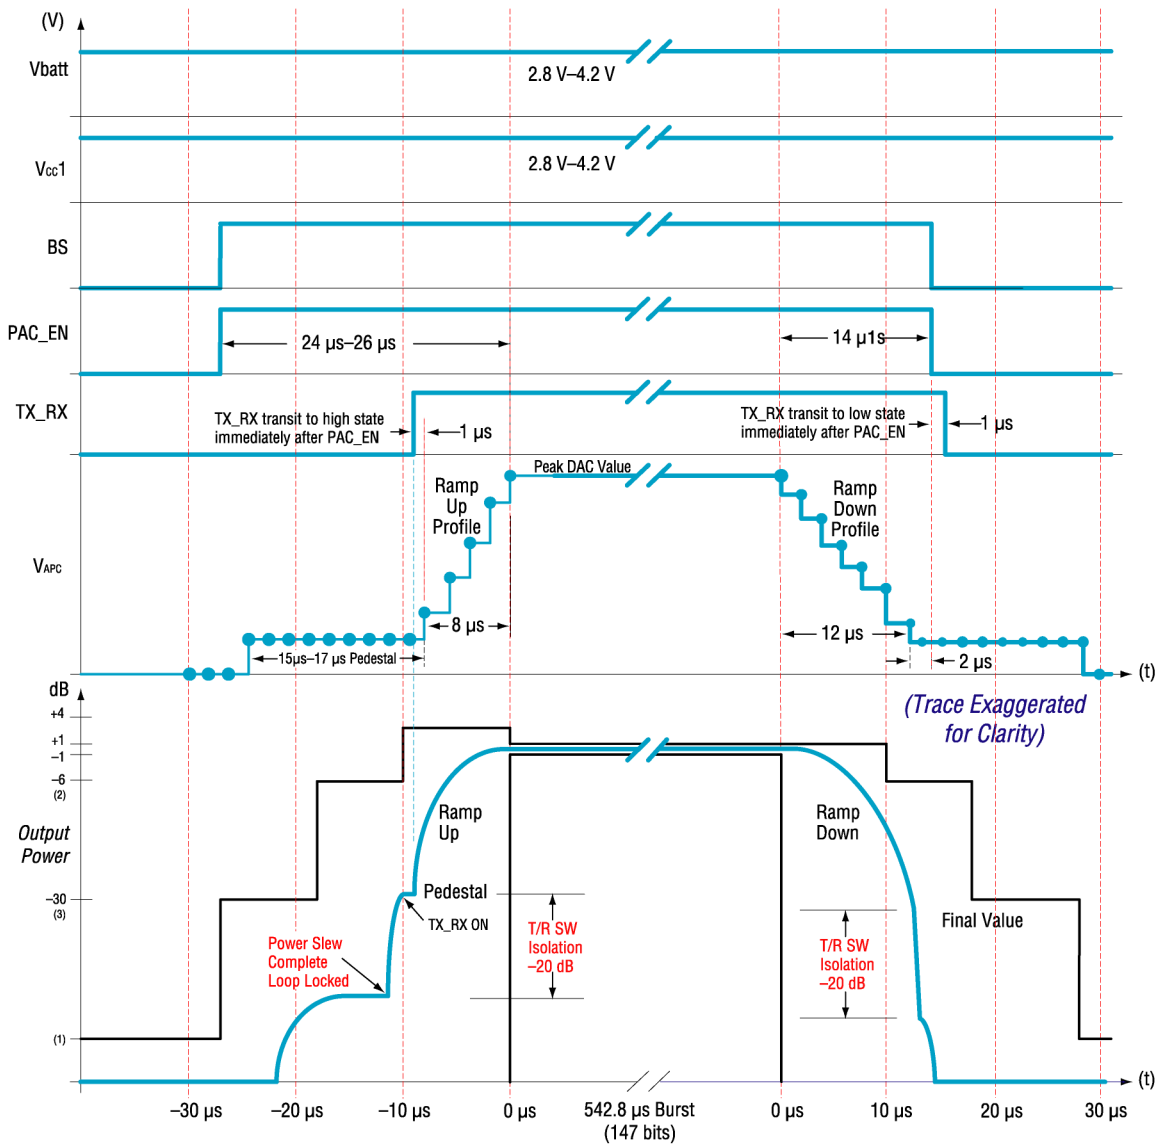

Figure 8 represents the dynamic characteristics of the RF output

burst power that results from the ramp profile delivered by the DAC to the  $V_{APC}$  input. The transmit power must not exceed the given limits at the time specified relative to the start and end of the data burst. Additional requirements are placed on spectral components generated by switching transients. Ramping at high rates will result in components that violate these spectral limits. A ramp control signal must be applied to the  $V_{APC}$  pin, which results in the desired power ramp response. The log relationship of  $V_{APC}$  to  $P_{OUT}$ , along with the finite bandwidth and potential slew rate limitations of the feedback loop, results in a complex mapping of the ramp profile to the actual output power. Careful attention is required in generating the input waveform which results in the desired output response.

Figure 9 shows an example of the Skyworks PAM test setup for evaluation of RF performance with various ramp profiles. The user's test setup may also include a TX/RX switch and a diplexer in the output signal path. Alternatively, the SKY77324 PAM may be installed in a phone board.

Figure 10 shows an example Skyworks software interface for the setup in Figure 9 that can be used to create a recommended DAC ramp profile. This profile is loaded from the computer into the Skyworks emulator board during test. The software also handles the required PAC Enable and TX\_RX control signal timing.

Figure 11 and Figure 12 show the GSM and DCS/PCS calibration screens, respectively, called up from the ramp profile interface in Figure 10. These calibrations, done for each PAM, generate an output power versus  $V_{APC}$  curve from sample data. Points from this curve are combined with the ramp coefficients to generate the DAC ramp during handset operation or test.

(1)	For GSM850 / EGSM	-59 dBc or -36 dBm, whichever is higher.
	For DCS1800/PCS1900	-48 dBc or -48 dBm, whichever is higher.
(2)	For GSM850 / EGSM	-4 dBc for power control level 16, -2 dBc for power control level 17, -1 dBc for power control level 18 and 19.
	For DCS1800/PCS1900	-4 dBc for power control level 11, -2 dBc for power control level 12, -1 dBc for power control level 13, 14, 15.
(3)	For GSM850 / EGSM	-30 dBc or -17 dBm, whichever is higher.
	For DCS1800/PCS1900	-30 dBc or -20 dBm, whichever is higher.

**Open Loop Control Mode**

With PAC ENABLE at a logic low, the voltage applied to V<sub>APC</sub> is buffered and applied directly to the bases of the RF devices. This mode of operation provides backward compatibility with the existing amplifier designs and allows for various test scenarios. As with previous designs, an active clamp acts as a protection mechanism limiting the maximum voltage that can be applied to

the base of the RF devices. This clamp voltage decreases with increasing supply voltage.

The enable threshold on the V<sub>APC</sub> input for open loop operation exhibits a wide tolerance, which may vary from 200 mV to 800 mV. When enabled in Open Loop mode, the internal PAC circuitry (V-I converter and integrator) is placed in standby.

## Ordering Information

Model Number	Manufacturing Part Number	Package	Operating Temperature
SKY77324	SKY77324	6 x 8 x 1.2 mm	-20 °C to +100 °C

## Revision History

Revision	Level	Date	Description
A		September 18, 2003	Initial Release
B		September 29, 2003	Revise: Table 3
C		January 7, 2004	Revise: Table 3
